# **THE NUMBERS HAVE AN END**

**Mohamed Ababou**

**Translated by: Mazida, Nafissa Atlagh**

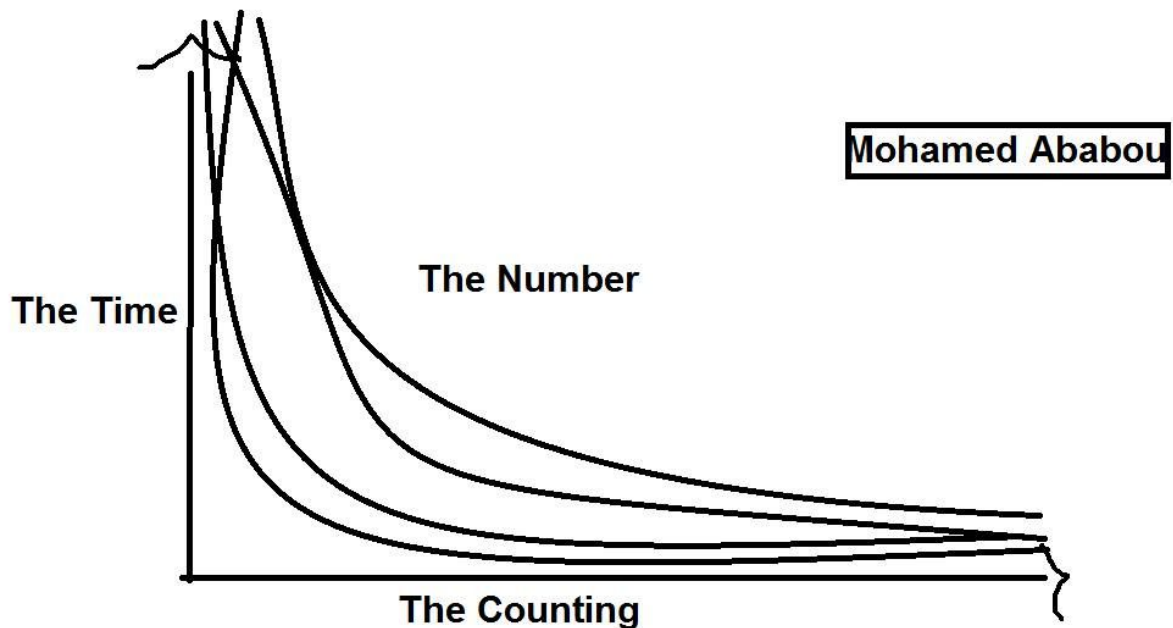

The ideas of the theory of the numbers have an end has sparked many debate in the mathematics - the war of the numbers have an end; and that the previous novel by the **“Do You Know That The Digits Have An End?”** is not accept by mathematical community. The “false” mathematics claim issue with my proofs provided in previous novel. I will now be provide strengthening the proofs of previous novel also new proofs of the theory of the numbers have an end to fix broken mathematics.

When the God created the human and gift the conscience, which is, the source of perception, comprehending, meditation, and insight. The human are able to explain of natural phenomena and artificial phenomena including the sciences; the mathematics. This distinguishes humans from other creatures by

the mind and the logic. The mathematics is the ideas based in truth and created by logic. By the logic we arrive at an exact science: a science based only in truth and the human perception. Because when God created the mathematics did He leave a conflict? And this is the purity of the idea of the numbers have an end.

The Proof of the theory of the numbers have an end is logic and the brains. First to recognize the digit = the number and the digit is from counting. Number is the most basic of mathematics and all of mathematics could not exist. The time and the counting are together as logic: this is true. Without the time the counting could not progress. And the time is simply of God's creation and will. So is it not that the counting is God's, and that since God is

not an end or a beginning that the digits have an end?

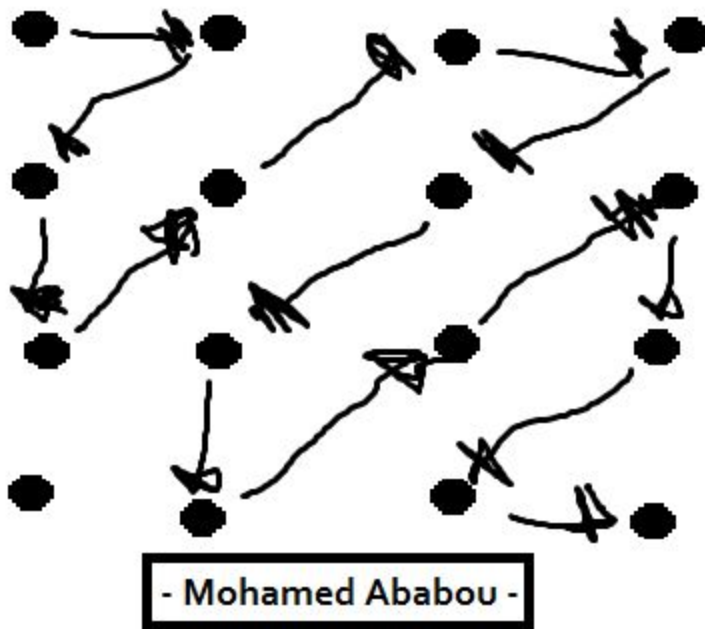

Together with the numbers of addition; subtractions; multiplications; divisions it is the mathematics of human beings= the exact sciences of the mind and logic.

The next of the proof of the theory of the numbers have an end is the consideration of the points of all space: the great mathematicians Euclid; Cantor; etc... knew of

proof but refused to spread the idea of the numbers have an end.

Because let space as a set of points. Then is it not that a human counts them? And as previous logic it follows= The digits have an end!

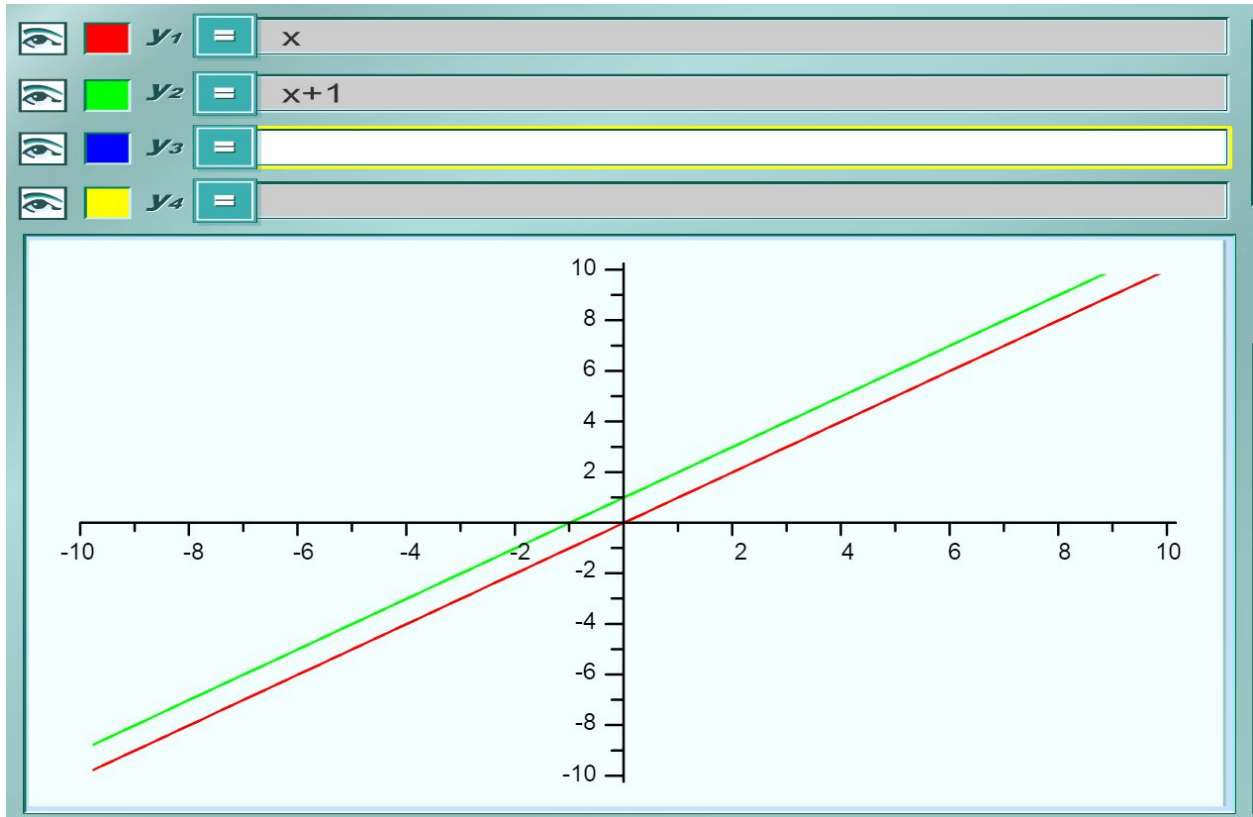

Is it not that the human can count the point of space? Then the truth: the digits have an end!

Think of the space that is on the world. It is weird if the space is infinity since the humans,

plants, atoms, etc; have an end. Then the truth becomes clear to us that the numbers must have an end!!!!

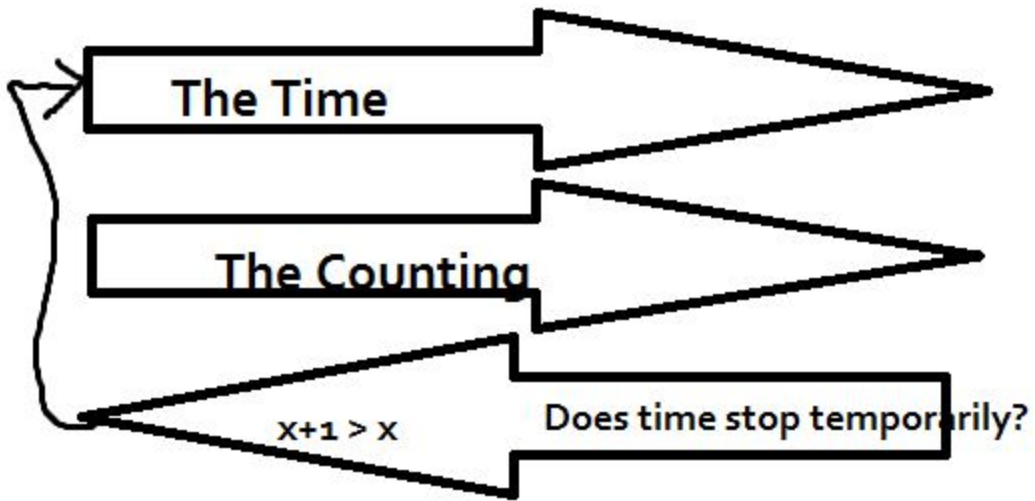

It does not make sense why people believe that the digits have no end. It is that they are love the concept of the equation  $x < 1+x$  and following related ideas and equation. It is the following graph shows the nonsense of such equation: There is no solution! And so the numbers must have an end.

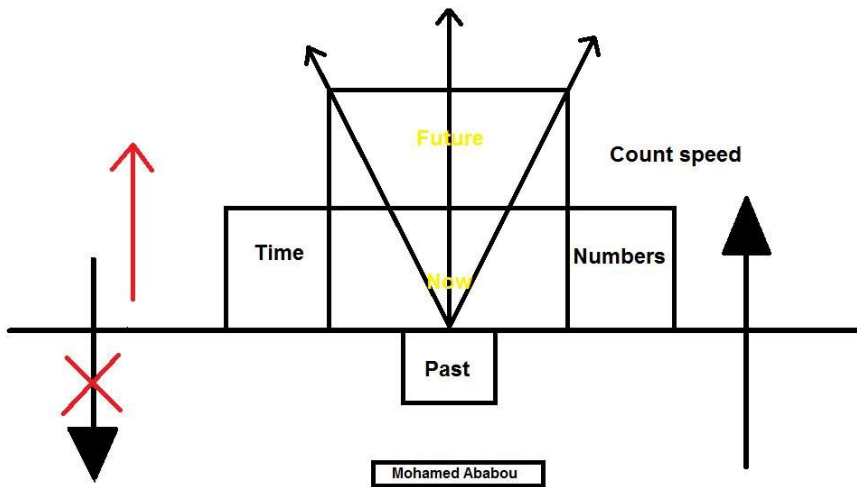

The weird part of the mathematics is not that large digits are possible but that the idea of the infinity is a number; the malformity that exhausts the brains. The classrooms are teaching the error that the numbers do not have an end, where the real theory is found by the student with an adequate logic and questions the common mathematics.

The misconception in the modern mathematics is the time. As the counting and the numbers, are the same, and so is the time. The fullness of the numbers and the counting are from time. If the numbers had no end would the time then end? And since the time is of God then would God cease to exist? If the  $x+1>x$  is used then is it not that the time has ended temporarily with the digits and equation? Then we are convinced: the numbers have an end.

- Mohamed Ababou -

The liar and fool will say to you i am incorrect: know that the digits have an end and be sure to yourself. The ask for the largest number or the end of all numbers but it is the digits end temporarily and so the counting may continue after. But if the time in counting is lost then is number not lost and so information and mathematics lost? Then remember the idea of the numbers as a stream with its flow and the water not lost then God provides a replenishing of the time.

The reality of the mathematics is that all are countings and so we can examine. For example;  
0: Before Adam PBUH, There was no existence for the human being.

1: It's Adam PBUH, the beginning of digits

(+)

The period from the existence of Adam PBUH, passing by the period of the Prophet Mohammed PBUH, to the current moment.

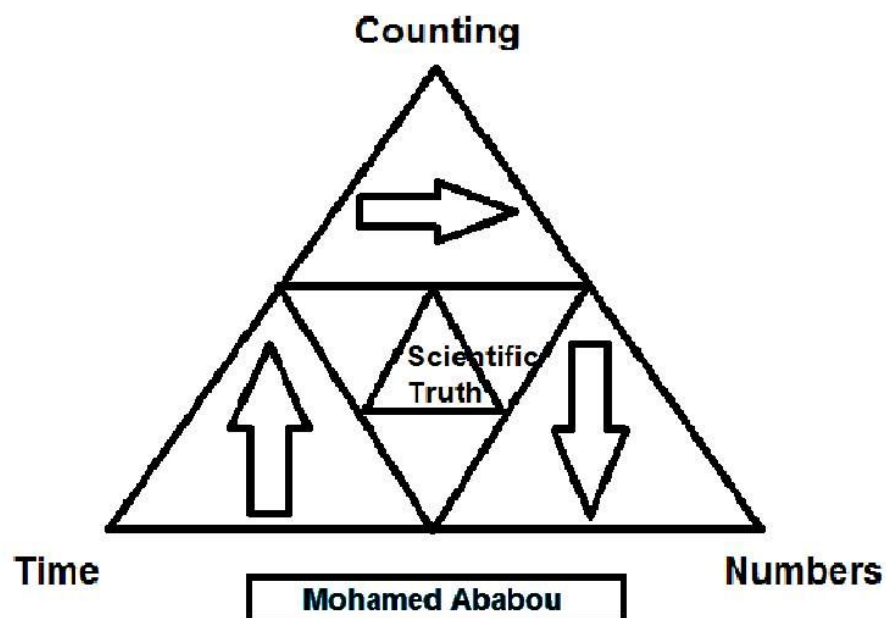

(+)

The world population currently.

(+)

24 hour(+) to the last day.

The truth is that all things are counting and related to the human existence and so how could the numbers have no end?

Another error in the mathematics is the zero and the division. Zero, is the identity, the no things, zero time. It is fact that when division occurs a time is split; for two by one is division of two to one group so two. But by the division of zero is an error occurred? The current mathematics: yes; but, when thought, if one possesses an apple and divides it to zero groups is it not that the apple remains as it is? And so the idea of the division of zero is solved=with the numbers have an end,  $1 / 0 = 1$ . The doubters will saying that  $1/0 = \text{infinity}$  or  $= 1$  or  $= \text{anything}$  but the truth is that the apple does not change by the logic of mathematics. To repair the numbers of division by the theory of the numbers have an end.

For studies the ideas contained in this novel and previous **“Do You Know That The Digits Have An End?”** the ideas are of a mind and a logic and so research is simply by expansion of previous ideas by the sound addition of truths. It does not require that the creator teaches to the pupils but that the pupils accept and examine the ideas themselves and verify with the logic that they are true.

The ideas of the numbers have an end are concrete and simple for understanding of layperson and classmate and colleague. For sharing to progress the theory of the numbers have an end! The only mathematical progress is from the creation and the sharing of ideas and so restriction is death of ideas and cannot be. So tell the idea to the world: the numbers end!!

Mohamed Ababou

Amateur writer of short stories and very short stories and plays.

An amateur of science.
