

All about Chemical peeling treatment procedures

Chemical peeling is a type of cosmetic treatment that involves the application of chemical solutions on the hands, neck, and face. This procedure helps in exfoliating the skin to reveal new skin underneath which is much smoother and free of wrinkles. People tend to opt for chemical peeling treatment as a cure for the following:

- Acne scars
- Sun damage
- Fine lines and wrinkles
- Melasma
- Hyperpigmentation
- Uneven skin tone

Different varieties of chemical peels available

- **Superficial peels-** Made from mild acids and penetrate only the outermost layer of the skin.
- **Medium peels-** Consist of trichloroacetic acid and can reach up to the middle layer of the skin. Mostly used for or removing damaged skin cells
- **Deep peels-** These chemicals are much stronger and can penetrate deep into the skin for the removal of damaged skin cells. Deep peels are made from phenol or trichloroacetic acid.
