Etoposide phosphate (Bristol Myers Squibb) 0.09 mg/mL in sodium chloride 0.9% did not result in the loss of viability of *Staphylococcus aureus*, *Enterococcus faecium*, *Pseudomonas aeruginosa*, and *Candida albicans* within 120 hours at 22 °C. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods. <sup>(2740)</sup>

*Light Effects* — An evaluation of etoposide phosphate (Bristol-Myers Squibb) 2 mg/mL, doxorubicin hydrochloride 0.4 mg/mL, and vincristine sulfate 0.016 mg/mL (16 mcg/mL) in sodium chloride 0.9% in polyolefin plastic bags (McGaw) found little or no effect of constant exposure to normal fluorescent room light for 124 hours. The admixtures were physically compatible, and all three drugs in the admixture remained stable throughout the time stored at an elevated temperature of 35 to 40

°C. (2343)

*Syringes* — Etoposide phosphate (Bristol Laboratories Oncology Products) 10 and 20 mg/mL was prepared with bacteriostatic water for injection preserved with benzyl alcohol 0.9% (Abbott). The solutions were packaged as 4 mL of solution in 5-mL polypropylene syringes (Becton-Dickinson) and sealed with tip caps (Red Cap, Burrin Medical). The syringes were stored at 32 °C for seven days, 23 °C for 31 days, and 4 °C for 31 days. All samples were physically stable, with no visual change and no increase in measured haze or particle content, and little drug loss occurred. At 32 °C, 2 to 4% loss occurred in seven days. At 23 °C, about 6 to 7% loss occurred in 31 days. Losses under refrigeration were 4% or less in 31 days. (2219)

## Compatibility Information

### Solution Compatibility

#### Etoposide phosphate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	ab	BMS	100 mg	Compatible and stable for 24 hr at 4 and 25 °C	1(6/07)	C
Dextrose 5%	BA <sup>a</sup>	BR	0.1 and 10 g	Physically compatible and little loss in 7 days at 32 °C and in 31 days at 23 and 4 °C	2219	C
Sodium chloride 0.9%	ab	BMS	100 mg	Compatible and stable for 24 hr at 4 and 25 °C	1(6/07)	C
Sodium chloride 0.9%	BA <sup>a</sup>	BR	0.1 and 10 g	Physically compatible and little loss in 7 days at 32 °C and in 31 days at 23 and 4 °C	2219	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in glass containers.

### Additive Compatibility

#### Etoposide phosphate

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Doxorubicin HCl with vincristine sulfate	PHU LI	120 mg 5 mg	BMS	600 mg	NS <sup>a</sup>	Physically compatible. Little loss of any drug in 124 hr at 4 and 40 °C	2343	C
Doxorubicin HCl with vincristine sulfate	PHU LI	240 mg 10 mg	BMS	1.2 g	NS <sup>a</sup>	Physically compatible. Little loss of any drug in 124 hr at 4 and 40 °C	2343	C
Doxorubicin HCl with vincristine sulfate	PHU LI	400 mg 16 mg	BMS	2 g	NS <sup>a</sup>	Physically compatible. Under 4% loss of any drug in 124 hr at 4 and 40 °C	2343	C

Etoposide Phosphate - AHFS 10:00

## Etoposide - AHFS 10:00

**Products** — Etoposide 20 mg/mL is available in 5-, 25-, and 50-mL multiple-dose vials. Each milliliter also contains polyethylene glycol 300 650 mg, ethanol 30.5% (v/v), polysorbate 80 80 mg, benzyl alcohol 30 mg, and citric acid 2 mg. <sup>(1-2/06)</sup>

*pH* — From 3 to 4. <sup>(1-2/06)</sup>

**Administration** — Etoposide should be diluted for administration and given by slow intravenous infusion; concentrations of 0.2 to 0.4 mg/mL should be given over at least 30 to 60 minutes. <sup>(1-2/06)</sup>  
(4)

Continuous intravenous infusion has also been used. The drug should not be given by rapid intravenous injection. <sup>(4)</sup>

The surfactant content of the etoposide formulation decreases surface tension and has been found to produce a 30% reduction in drop size compared to simple aqueous solutions. The altered drop size may interfere with accurate infusion rates if infusion devices that rely on drop counting are used. The use of infusion devices that operate independently of drop size has been recommended. <sup>(181)</sup>

The manufacturer notes that accidental exposure to this potentially toxic agent may cause skin reactions. Therefore, protective gloves and syringes with Luer-Lok fittings should be used during preparation of solutions. A soap and water wash should be employed after accidental contact with the skin or mucosa. <sup>(1-2/06)</sup> (4)

In the event of spills or leaks, the use of sodium hypochlorite 5% (household bleach) or potassium permanganate 1% to inactivate etoposide has been recommended. <sup>(1200)</sup>

**Stability** — Store intact containers at controlled room temperature. <sup>(1-2/06)</sup> Stability is not affected by exposure to normal room fluorescent light. <sup>(1374)</sup>

Devices composed of hard ABS plastic may be incompatible with undiluted etoposide. In one study, a multiport disposable infusion cassette (Omni-Flow) developed cracks within five minutes after infusion was started and leakage was evident within 15 minutes. This phenomenon did not occur when etoposide was diluted to concentrations up to 1 mg/mL. In addition, a venting pin and a connector on an extension set reportedly cracked. Exposure to the polyethylene glycol 300 content of the etoposide formulation can cause cracks in minutes. However, dehydrated alcohol did not cause any cracks within one hour. <sup>(1261)</sup>

Immersion of a needle with an aluminum component in etoposide (Bristol) 20 mg/mL resulted in no visually apparent reaction after seven days at 24 °C. <sup>(988)</sup>

*Precipitation* — Dextrose 5% and sodium chloride 0.9% have been recommended as diluents for the infusion of etoposide. The aqueous solubility of etoposide is poor (0.03 mg/mL), but the formulation temporarily increases its miscibility in an aqueous medium. Nevertheless, the drug will eventually crystallize in varying time periods, and the crystallization is reported to be exacerbated by peristaltic pumps. <sup>(1949)</sup> At concentrations of 0.2 and 0.4 mg/mL in dextrose 5% and sodium chloride 0.9%, the solutions are stable for 96 and 24 hours, respectively, at 25 °C under normal fluorescent light in either glass or plastic containers. However, precipitation in shorter time periods has been observed. At concentrations of 0.2 and 0.4 mg/mL in Ringer's injection, lactated, or mannitol 10% in glass containers under the same conditions, the solutions are stable for eight hours. No precipitate formed in 72 hours at 20 °C in solutions of etoposide 0.4 mg/mL in dextrose 5% in sodium chloride 0.45%. <sup>(1162)</sup> However, at 1 mg/mL, crystallization may occur in 30 minutes in a standing solution or five minutes if the solution is stirred. Occasionally, 1-mg/mL concentrations may remain in solution for extended periods. <sup>(1374)</sup> Nevertheless, concentrations greater than 0.4 mg/mL are not recommended

by the manufacturer. Because of the poor solubility of etoposide in aqueous media, monitor closely for precipitation before and during administration. [\(1-2/06\)](#) [\(4\)](#) [\(915\)](#) [\(916\)](#)

The rate of precipitation of a supersaturated etoposide solution depends on the presence of crystalline nuclei, agitation, contact with incompatible surfaces, and possibly other factors. [\(1374\)](#)

Etoposide 1 mg/mL in sodium chloride 0.9% in polypropylene syringes (Braun Omnifix) developed a pure etoposide precipitate in about 10% of the prefilled syringes. It also precipitated at various locations in subclavian lines. [\(1564\)](#)

Precipitation of etoposide from infusion solutions is reportedly exacerbated by the use of peristaltic pumps, especially at concentrations of 0.4 mg/mL or above. Use of volumetric pumps has been recommended to reduce this problem. [\(1832\)](#) [\(1949\)](#)

*pH Effects* — Etoposide is most stable at a pH of about 3.5 to 6, with a calculated minimum degradation rate occurring at pH 4.8. [\(1262\)](#) Epimerization to the less active *cis*-etoposide may occur at pH values above 6. Hydrolysis may occur in alkaline solutions. [\(1379\)](#)

*Syringes* — When etoposide 1 mg/mL in sodium chloride 0.9% was stored in plastic syringes (Gillette), seizing of the syringes occurred. [\(1564\)](#)

*Ambulatory Pumps* — Etoposide (Bristol-Myers Squibb) 0.5 mg/mL in sterile water for injection was evaluated for stability and compatibility in PVC reservoirs of Graseby 9000 ambulatory pumps. Etoposide was chemically stable at 37 °C for seven days with no loss of drug. However, refrigerated storage at 4 °C resulted in precipitation of the etoposide in some samples. In addition, substantial amounts of diethylhexyl phthalate (DEHP) plasticizer (up to 90 mcg/mL) were leached from the PVC reservoirs. The authors concluded that etoposide was unsuitable for use in this pump reservoir and recommended consideration of etoposide phosphate, which should not be subject to precipitation and leaching of plasticizer. [\(2288\)](#)

*Sorption* — No loss of etoposide because of sorption to PVC containers has been observed. [\(1374\)](#) At a concentration of 0.2 mg/mL in dextrose 5% or sodium chloride 0.9% in PVC containers, no etoposide loss due to sorption was found during 72 hours at 5 and 25 °C. [\(1369\)](#)

In an admixture composed of cytarabine (Upjohn) 0.157 mg/mL, daunorubicin hydrochloride (Bellon) 15.7 mcg/mL, and etoposide (Sandoz) 0.157 mg/mL in dextrose 5%, little or no loss of the drugs due to sorption occurred when delivered through PVC, PVC with polyethylene-lined sets, and silicone central catheter. [\(1955\)](#)

*Plasticizer Leaching* — The surfactant in the etoposide formulation leaches DEHP plasticizer from PVC containers and tubing. The amount of DEHP leached is variable, depending on surfactant concentration, container size, tubing diameter and length, ambient temperature, DEHP concentration in the plastic, and contact time. The use of non-PVC containers and tubing has been recommended to reduce patient exposure to DEHP. If there is sufficient concern, the use of the water-soluble ester form, etoposide phosphate, which does not leach DEHP plasticizer, could be used.

Etoposide 0.4 mg/mL in PVC bags of dextrose 5% leached relatively minor amounts of DEHP plasticizer from PVC bags. This leaching was due to the surfactant polysorbate 80 (Tween 80) in the formulation. After 24 hours at 24 °C, the DEHP concentration in 50-mL bags of infusion solution was 2.6 mcg/mL. This finding is consistent with the low surfactant concentration (0.16%) in the final admixture solution. The actual amount of DEHP leached from PVC containers and administration sets may vary in clinical situations, depending on surfactant concentration, bag size, and contact time. [\(1683\)](#)

Etoposide (Sandoz) 0.4 mg/mL in sodium chloride 0.9% in PVC containers leached DEHP plasticizer from the container material. This leaching increased with storage time from about 12 mcg/mL in

eight hours to over 50 mcg/mL in 96 hours at 24 °C. Refrigeration reduced, but did not eliminate, DEHP leaching. <sup>(1833)</sup>

Etoposide (Novartis) 0.4 mg/mL in dextrose 5% and sodium chloride 0.9% was evaluated for the leaching of DEHP plasticizer from PVC bags of the infusion solution from four manufacturers (Aguettant, Baxter, Biosedra-Fresenius, and Macopharma) over 24 hours stored at 24 °C. Both solutions from all manufacturers leached DEHP in amounts near 20 mcg/mL. <sup>(2447)</sup>

The low-density polyethylene inner linings of trilayer Vygon tubing and bilayer Cair tubing have been reported not to act as effective barriers to DEHP leaching from the outer PVC layers. Leached DEHP was nearly identical to plain PVC tubing. <sup>(2587) (2605)</sup>

*Filtration* — Etoposide 0.1 to 0.4 mg/mL in dextrose 5% or sodium chloride 0.9% has been filtered through several commercially available filters (such as the 0.22-µm Millex-GS or Millex GV) without filter decomposition. <sup>(4)</sup>

Etoposide (Sandoz) 0.2 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22-µm cellulose ester membrane filter (Ivex-HP, Millipore) over six hours. No significant drug loss due to binding to the filter was noted. <sup>(1034)</sup>

*Central Venous Catheter* — Etoposide infused undiluted at a rate of 30 mL/hr for 24 hours through a polyurethane central catheter caused substantial damage to the catheter. In addition to cracking the catheter, a 36% decrease in elasticity, a 3.7% increase in catheter length, and damage similar to melting on the internal catheter wall were found. The damage also occurred with the etoposide vehicle and ethanol alone. Consequently, the damage was attributed to the ethanol component of the formulation. <sup>(2286)</sup>

The damage to polyurethane catheters caused by the etoposide formulation did not extend to silicone central catheters. Administration of undiluted etoposide could be performed using silicone catheters. <sup>(2286)</sup>

## Compatibility Information

## Famotidine - AHFS 56:28.12

**Products** — Famotidine is available as a 10-mg/mL concentrated injection in 2-mL single-dose vials and 4- and 20-mL multiple-dose vials. Each milliliter of the solution also contains l-aspartic acid 4 mg and mannitol 20 mg. Benzyl alcohol 0.9% is present as a preservative in the multiple-dose product. <sup>(1-10/06)</sup>

Famotidine is also available premixed at a concentration of 20 mg/50 mL. Each 50 mL of solution also contains l-aspartic acid 6.8 mg and sodium chloride 450 mg in water for injection. Additional l-aspartic acid or sodium hydroxide may be added to adjust the pH. <sup>(1-10/06)</sup>

*pH* — The injection has a pH from 5 to 5.6. <sup>(4)</sup> The premixed solution has a pH from 5.7 to 6.4. <sup>(1-10/06)</sup>

*Osmolarity* — The osmolarities of the single- and multiple-dose products are 217 and 290 mOsm/L, respectively. <sup>(4)</sup>

*Sodium Content* — Famotidine premixed infusion solution has 7.8 mEq of sodium per 50 mL. <sup>(4)</sup>

*Trade Name(s)* — Pepcid

**Administration** — Famotidine is administered by slow intravenous injection or infusion. For injection, 20 mg should be diluted to 5 to 10 mL with a compatible diluent and injected no faster than 10 mg/min. For infusion, 20 mg should be diluted in 100 mL of dextrose 5% or another compatible diluent and infused over 15 to 30 minutes. Alternatively, famotidine premixed solution may be administered by intravenous infusion over 15 to 30 minutes. <sup>(1-10/06)</sup> <sup>(4)</sup>

**Stability** — Famotidine injection is a clear, colorless solution. The vials should be stored under refrigeration and protected from freezing. If freezing occurs, thaw at room temperature; make sure that all components have resolubilized. <sup>(1-10/06)</sup> <sup>(4)</sup> Use of a microwave oven for thawing is not recommended because of the potential hazard of vapor pressure increases in the vials. <sup>(4)</sup>

Although refrigeration is recommended, the manufacturer has indicated that the drug may be stored at room temperature for 26 weeks <sup>(1239)</sup> and for three months <sup>(2745)</sup> at controlled room temperature in differing statements.

Famotidine premixed infusion solution should be stored at controlled room temperature (25 °C) and protected from excessive heat. Brief exposure to temperatures up to 35 °C does not affect the stability of the product adversely. <sup>(1-10/06)</sup>

*Freezing Solutions* — Famotidine (MSD) 200 mcg/mL in dextrose 5% or sodium chloride 0.9% in PVC bags showed no loss when frozen at -20 °C for 28 days followed by storage at 4 °C for 14 days. <sup>(1271)</sup>

Famotidine (MSD) 2 mg/mL in dextrose 5%, sodium chloride 0.9%, or sterile water for injection stored in polypropylene syringes (Becton Dickinson) exhibited a 5 to 8% loss in eight weeks when frozen at -20 °C. <sup>(1486)</sup>

*Syringes* — Famotidine (MSD) 2 mg/mL in dextrose 5%, sodium chloride 0.9%, or sterile water for injection stored in plastic syringes (Becton Dickinson) exhibited no loss in 14 days at 4 °C. <sup>(1487)</sup>

*Central Venous Catheter* — Famotidine (Merck) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no

substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Famotidine

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%				Under 10% loss in 7 days at room temperature	<a href="#">1(10/06)</a>	C
Dextrose 5%	TR <sup>a</sup>		200 mg	Physically compatible with 6% loss in 15 days at 25 °C and no loss in 63 days at 5 °C	<a href="#">1342</a>	C
Dextrose 5%		MSD	20 mg	No loss in 48 hr at 25 °C in light or dark and at 5 °C	<a href="#">1344</a>	C
Dextrose 5%	AB <sup>ab</sup>	ME	200 mg	Visually compatible with less than 5% loss in 15 days at 22 °C both in dark and light	<a href="#">1936</a>	C
Dextrose 10%				Under 10% loss in 7 days at room temperature	<a href="#">1(10/06)</a>	C
Ringer's injection, lactated				Under 10% loss in 7 days at room temperature	<a href="#">1(10/06)</a>	C
Sodium chloride 0.9%				Under 10% loss in 7 days at room temperature	<a href="#">1(10/06)</a>	C
Sodium chloride 0.9%	TR <sup>a</sup>		200 mg	Physically compatible with little or no loss in 15 days at 25 °C and in 63 days at 5 °C	<a href="#">1342</a>	C
Sodium chloride 0.9%		MSD	20 mg	No loss in 48 hr at 25 °C in light or dark and at 5 °C	<a href="#">1344</a>	C
Sodium chloride 0.9%	AB <sup>ab</sup>	ME	200 mg	Visually compatible with less than 5% loss in 15 days at 22 °C both in dark and light	<a href="#">1936</a>	C
TNA #111, #112 <sup>c</sup>		MSD	20 and 50 mg	Physically compatible. Little loss and no change in fat particle size in 48 hr at 4 and 21 °C	<a href="#">1332</a>	C
TNA #114 <sup>c</sup>		MSD	20 and 40 mg	Physically compatible. No loss and no change in fat particle size in 72 hr at 21 °C in light	<a href="#">1333</a>	C
TNA #182 <sup>c</sup>		MSD	20 mg	Visually compatible. No loss in 24 hr at 24 °C in light	<a href="#">1576</a>	C
TNA #197 to #200 <sup>c</sup>		MSD	20 mg	Physically compatible. No loss in 48 hr at 22 °C in light	<a href="#">1921</a>	C
TPN #109, #110 <sup>c</sup>		MSD	20 and 40 mg	Physically compatible with no famotidine loss and little change in amino acids in 48 hr at 21 °C and in 7 days at 4 °C	<a href="#">1331</a>	C
TPN #113 <sup>c</sup>		MSD	20 mg	Physically compatible. Little loss in 35 days at 4 °C in light	<a href="#">1334</a>	C
TPN #115, #116 <sup>c</sup>		MSD	16.7 and 33.3 mg	No famotidine loss in 7 days at 23 and 4 °C	<a href="#">1352</a>	C
TPN #196 <sup>c</sup>		MSD	20 mg	Physically compatible. No loss in 48 hr at 22 °C in light	<a href="#">1921</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polypropylene syringes.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

**Additive Compatibility****Famotidine**

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Cefazolin sodium	FUJ	10 g	YAM	200 mg	D5W	Visually compatible with 10% cefazolin and 5% famotidine loss in 24 hr at 25 °C. 9% cefazolin and 5% famotidine loss in 48 hr at 4 °C	<a href="#">1763</a>	C
Fat emulsion, intravenous		10%	MSD	200 mg		Little loss in 48 hr at 25 °C in light or dark and at 5 °C	<a href="#">1344</a>	C
Flumazenil	RC	20 mg	MSD	80 mg	D5W <sup>a</sup>	Visually compatible. 3% flumazenil loss in 24 hr at 23 °C in fluorescent light. Famotidine not tested	<a href="#">1710</a>	C
Vancomycin HCl	AB	5 g	YAM	200 mg	D5W <sup>b</sup>	Visually compatible. 9% vancomycin and 6% famotidine loss in 14 days at 25 °C. At 4 °C, 4% loss of both drugs in 14 days	<a href="#">2111</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in methyl-methacrylate-butadiene-styrene plastic containers.

**Y-Site Injection Compatibility (1:1 Mixture)****Famotidine**

## Fat Emulsion, Intravenous - AHFS 40:20

**Products** — The compositions and characteristics of the fat emulsion products are listed in Table 1.

The pH of fat emulsion, intravenous, products is adjusted with sodium hydroxide.

**Table 1. Composition and Characteristics of Several Intravenous Fat Emulsions** [513](#) [655](#)

Component or Characteristic	Intralipid (Fresenius Kabi)			Liposyn III (Abbott)		
	10%	20%	30% <sup>a</sup>	10%	20%	30% <sup>a</sup>
Soybean oil	10%	20%	30% <sup>a</sup>	10%	20%	30% <sup>a</sup>
Safflower oil	-	-	-	-	-	-
Egg yolk phospholipids	1.2%	1.2%	1.2%	up to 1.2%	1.2%	1.8%
Glycerin	2.25%	2.25%	1.7%	2.5%	2.5%	2.5%
Water for injection	qs	qs	qs	qs	qs	qs
Osmolarity (mOsm/L)	260	260	310	284	292	293
Approximate pH	6-8.9	6-8.9	6-8.9	6-9	6-9	6-9
Fat particle size (µm)	0.5	0.5	0.5	0.4	0.4	0.4
Caloric value (kcal/mL)	1.1	2	3	1.1	2	2.9

<sup>a</sup>Not for direct infusion. Must be diluted to 20% or less for administration.

**Administration** — Fat emulsion, intravenous, 10 and 20% may be administered intravenously via a peripheral vein or by central venous infusion.

Fat emulsion, intravenous, may also be administered intravenously in total nutrient admixtures (TNA, 3-in-1) in combination with amino acids, dextrose, and other nutrients. Fat emulsion, intravenous 30% is not for direct intravenous administration; it is intended for use as a component in parenteral nutrition admixtures. [\(513\)](#) [\(655\)](#)

**Stability** — Fat emulsion, intravenous, products may be stored in the intact containers at controlled room temperature. They should be protected from freezing. [\(513\)](#) [\(655\)](#)

Several factors can influence the stability of fat emulsions. A two-year study of Intralipid 10% found an increase in free fatty acids and a decrease of pH on storage. Gross particles formed and toxicity to rabbits increased with time. These changes were greatest during storage at 40 °C but were measurable at 20 and even 4 °C. The toxicity of the emulsions to rabbits could be correlated to the extent of free fatty acid formation in the emulsions. The formation of free fatty acids, with a consequent lowering of pH, is the major route of degradation of fat emulsions. The rate of degradation is minimized at pH 6 to 7. [\(889\)](#)

The container-closure system is important for long-term stability. Plastic containers are generally permeable to oxygen, which can readily oxidize the lipid emulsions, so glass bottles are used. Furthermore, the stoppers must not be permeable to oxygen and must not soften on contact with the emulsions. Teflon-coated stoppers have been recommended. Finally, the emulsions are packed under an atmosphere of nitrogen. [\(889\)](#)

The long-term room temperature stability of the emulsions is lost when the intact containers are entered. The integrity of the nitrogen layer in the sealed container is essential for room temperature stability. Exposure of Intralipid 10% to the atmosphere results in gradual changes in the emulsion system. No changes in the particle size distribution occurred during the first 36 hours of room temperature storage. After 48 hours at room temperature, globule coalescence was noticeable. By 72 hours, the changes had become significant. However, the visual appearance after 72 hours was unchanged. Long-term storage for 15 months at room temperature resulted in formation of a nonhomogeneous cream layer with oil globules on top. [\(656\)](#) [\(657\)](#) If the pH of the emulsion is optimal and the emulsion is stored under nitrogen and not exposed to direct sunlight, oxidative degradation is not likely to be significant. [\(889\)](#)

The manufacturers recommend that a partly used bottle should not be stored for later use, and no bottle should be used if the emulsion appears to be oiling out. <sup>(513)</sup> <sup>(655)</sup>

The emulsions should not be frozen. <sup>(513)</sup> <sup>(655)</sup> Freezing may cause physical damage. The emulsions may become coarse and coalesce, and they can undergo irreversible phase separation. If accidental freezing occurs, the products should be discarded. <sup>(559)</sup>

Fat emulsion, intravenous, based on either soybean oil or safflower oil, has been shown to support the growth of various microbes, including both bacterial and fungal species. No visual changes occurred in the emulsions to suggest contamination. <sup>(1102)</sup> <sup>(1103)</sup> <sup>(1104)</sup> <sup>(1216)</sup> The potential for microbiological growth should be considered when assigning expiration periods.

The 3-in-1 parenteral nutrition solutions that have a lower pH and higher osmolality due to the presence of amino acids and dextrose do not support microbial growth as well as fat emulsion alone. <sup>(1216)</sup>

*Plasticizer Leaching* — Fat emulsion extracts diethylhexyl phthalate (DEHP) plasticizer from PVC in amounts exceeding comparable volumes of whole blood. The amount of plasticizer leached from PVC sets by fat emulsion is directly related to the length of administration time and inversely related to the flow rate; these two factors influence the amount of contact time between the fat emulsion and the PVC tubing. Longer administration times and slower administration rates increase the amount of leached plasticizer. Non-PVC plastic containers, such as an ethylene vinyl acetate bag, may be used to avoid plasticizer exposure. If PVC tubing is used, phthalate leaching can be minimized by not storing primed sets. <sup>(658)</sup> <sup>(661)</sup> <sup>(673)</sup> <sup>(893)</sup> <sup>(1105)</sup>

Storage of Intralipid 10 and 20% for 24 hours in PVC sets resulted in phthalate contents of 64 to 70 mcg/mL at 5 °C and 144 to 160 mcg/mL at ambient temperature. When the fat emulsions were simply infused through PVC sets, phthalate content dropped to 3.6 to 8.5 mcg/mL. A patient being administered 500 mL of fat emulsion per day would receive about 1.5 to 2.75 mg/day. Negligible levels of phthalate were delivered from a parenteral nutrition admixture containing fat emulsion. <sup>(1264)</sup>

A parenteral nutrition solution containing an amino acid solution, dextrose, and electrolytes in a PVC bag did not leach measurable quantities of DEHP plasticizer during 21 days of storage at 4 and 25 °C. However, addition of fat emulsion 10 or 20% to the formula caused detectable leaching of DEHP from the PVC containers stored for 48 hours. Higher DEHP levels were found in the 25 °C samples than in the 4 °C samples. The authors recommended limiting the use of lipid-containing parenteral nutrition admixtures to 24 to 36 hours. Use of non-PVC containers and tubing is another option. <sup>(1430)</sup>

Total nutrient admixtures (TNA) with fat emulsion concentrations ranging from 1 to 3.85% were found to leach DEHP plasticizer even though they were packaged in ethylene vinyl acetate bags. The bags had PVC sites in their composition, which contributed the DEHP. Use of PVC administration sets added additional DEHP. Leached DEHP ranged from about 200 mcg to 2 mg during simulated infusions conducted immediately after preparation. The authors concluded that children who are treated regularly with TNA are exposed to significant amounts of DEHP. <sup>(2588)</sup>

*Filtration* — The use of a 1.2- or 5- $\mu$ m inline filter to remove particulates, aggregates, precipitates, and large fat globules has been suggested to protect patients during parenteral nutrition administration. <sup>(569)</sup> <sup>(1106)</sup> <sup>(2135)</sup> <sup>(2346)</sup> The particle size of the fat emulsion products may exceed the porosity of some inline filters. Such small porosity filters should not be used with fat emulsion products. <sup>(658)</sup> <sup>(1106)</sup>

**Additional Compatibility Information****Calcium and Phosphate — UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.**

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented<sup>(1771) (1777)</sup>, but the information is complex and difficult to apply to the clinical situation.<sup>(1770) (1772) (1777)</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that is present, which has led to substantial debate on the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>(1770) (1771) (1772) (2031) (2032) (2033) (2034) (2035) (2036)</sup> Because such precipitation may be life-threatening to patients<sup>(2037) (2291)</sup>, the Food and Drug Administration issued a Safety Alert containing the following recommendations<sup>(1769)</sup> :

1. "The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a three-in-one admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a two-in-one admixture with the lipid infused separately, or (2) if a three-in-one admixture is medically necessary, then add the calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

4. During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.
5. A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu$ m air-eliminating filter for lipid-

containing admixtures and a 0.22- $\mu$ m air-eliminating filter for non-lipid-containing admixtures.

6. Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

7. If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance."

### **Calcium Phosphate Precipitation Fatalities**

Fatal cases of paroxysmal respiratory failure in two previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures. <sup>(2037)</sup>

In a follow-up retrospective review, five patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these five patients died, although the cause of death could be definitively determined for only two. <sup>(2291)</sup>

### **Calcium and Phosphate Conditional Compatibility**

Calcium salts are conditionally compatible with phosphates in parenteral nutrition mixtures. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acid solutions inherently contain calcium and phosphate, which must be considered in any projection of compatibility.

*Dextrose* — Dextrose in final concentrations of 5 to 12.5% has been shown to cause a progressive coalescence of the globules in Intralipid 10% due to its alteration of pH from about 7 down to about 3.5 in 48 hours. <sup>(656)</sup>

*Monovalent Cations* — Monovalent cations such as potassium and sodium also cause progressive globule coalescence in Intralipid 10 and 20%, leading to surface creaming. <sup>(480) (490) (656) (890)</sup> The degree and rate of this effect are dependent on the concentration of the ions. A decreasing degree and rate of coalescence were noted as concentrations of sodium chloride or potassium chloride decreased. At 200 mEq/L, the rate is rapid and the effect is severe. In the range of 100 mEq/L or less, significant effects may not occur for over 24 hours. <sup>(490) (656)</sup>

*Divalent Cations* — Divalent cations such as calcium and magnesium cause immediate flocculation, with a nonhomogeneous white granular layer forming at the surface of the Intralipid 10%. This is followed by a substantial, visibly distinct layer, which does not redisperse on shaking. <sup>(480) (490) (656)</sup>

The creaming of Intralipid 20% when calcium chloride was admixed in concentrations from 0.25 to 5% was found to be concentration dependent, with maximum creaming occurring with the 5% additive in 30 minutes. [\(890\)](#)

*Multicomponent ("3-in-1") Admixtures* — Because of the potential benefits in terms of simplicity, efficiency, time, and cost savings, the concept of mixing amino acids, carbohydrates, electrolytes, fat emulsion, and other nutritional components together in the same container has been explored. Within limits, the feasibility of preparing such "3-in-1" parenteral nutrition admixtures has been demonstrated as long as a careful examination of the emulsion mixtures for signs of instability is performed prior to administration. [\(1813\)](#)

However, these 3-in-1 mixtures are very complex and inherently unstable. Emulsion stability is dependent on both zeta potential and van der Waals forces, influenced by the presence of dextrose. [\(2029\)](#) Because the ultimate stability of each mixture is the result of various complicated factors, a definitive prediction of stability is impossible. Death and injury resulted from administration of unrecognized precipitation in 3-in-1 parenteral nutrition admixtures. In addition, the use of 3-in-1 admixtures is associated with a higher rate of catheter occlusion and reduced catheter life compared with giving the fat emulsion separately from the parenteral nutrition solution. [\(705\)](#) [\(1518\)](#) [\(2194\)](#)

Intravenous administration of unstable fat emulsion with a large amount of large fat globules greater than 5 µm is potentially embolic and has been demonstrated to result in liver toxicity. [\(2690\)](#)

The use of a 5-µm inline filter for a 3-in-1 admixture (containing Travasol 8.5%, Dextrose, Intralipid 10%, various electrolytes, vitamins, and trace elements) showed that fat, in the form of large globules or aggregates, comprised 99.4% of the filter contents. These authors recommend the use of an appropriate filter (≤5 µm) for preventing catheter occlusion with 3-in-1 admixtures. [\(742\)](#)

The presence of glass particles, talc, and plastic has been observed in administration line samples drawn from 20 adults receiving 3-in-1 parenteral nutrition admixtures and in 20 children receiving 2-in-1 admixtures with separate fat emulsion infusions. Particles ranged from 3 to 5 µm to greater than 40 µm and were more consistently seen in the pediatric admixtures. The authors suggest the use of inline filters given that particulate contamination is present, has no therapeutic value, and can be harmful. [\(2458\)](#)

Combining an amino acids-dextrose parenteral nutrition solution containing various electrolytes with fat emulsion 20%, intravenous (Intralipid, Vitrum), resulted in a mixture that was apparently stable for a limited time. However, it ultimately exhibited a creaming phenomenon. Within 12 hours, a distinct 2-cm layer separated on the upper surface. Aggregates believed to be clumps of fat droplets were found. Fewer and smaller aggregates were noted in the lower layer. [\(560\)](#) [\(561\)](#)

Amino acids have been reported to have no adverse effect on the emulsion stability of Intralipid 10%. In addition, the amino acids appeared to prevent the adverse impact of dextrose and to slow the coalescence and flocculation resulting from mono- and divalent cations. However, significant coalescence did result after a somewhat longer time. Therefore, it was recommended that such cations not be mixed with fat emulsion, intravenous. [\(656\)](#)

Three-in-one TNA admixtures prepared with Intralipid 20% and containing mono- and divalent ions as well as heparin sodium 5 units/mL were found to undergo changes consistent with instability including fat particle shape and diameter changes as well as creaming and layering. The changes were evident within 48 hours at room temperature but were delayed to between one and two months when refrigerated. [\(58\)](#)

Travenol has stated that 1:1:1 mixtures of amino acids 5.5, 8.5, or 10% (Travenol), fat emulsion 10 or 20% (Travenol), and dextrose 10 to 70% are physically stable but recommends administration within 24 hours. M.V.I.-12 3.3 mL/L and electrolytes may also be added to the admixtures up to the maximum amounts listed below [\(850\)](#) :

Calcium	8.3 mEq/L
Magnesium	3.3 mEq/L
Sodium	23.3 mEq/L
Potassium	20 mEq/L
Chloride	23.3 mEq/L
Phosphate	20 mEq/L
Zinc	3.33 mg/L
Copper	1.33 mg/L
Manganese	0.33 mg/L
Chromium	13.33 mcg/L

The stability of mixtures of Intralipid 20% 1 L, Vamin glucose (amino acids with dextrose 10%) 1.5 L, and dextrose 10% 0.5 L with various electrolytes and vitamins was evaluated. Initial emulsion particle size was around 1  $\mu\text{m}$ . The mixture containing only monovalent cations was stable for at least nine days at 4 °C, with little change in particle size. The mixtures containing the divalent cations, such as calcium and magnesium, demonstrated much greater particle size increases, with mean diameters of around 3.3 to 3.5  $\mu\text{m}$  after nine days at 4 °C. After 48 hours of storage, however, these increases were more modest, around 1.5 to 1.85  $\mu\text{m}$ . After storage at 4 °C for 48 hours followed by 24 hours at room temperature, very few particles exceeded 5  $\mu\text{m}$ . It was found that the effect of particle aggregation caused by electrolytes demonstrates a critical concentration before the effect begins. For calcium and magnesium chlorides, the critical concentrations were 2.4 and 2.6 mmol/L, respectively. Sodium and potassium chloride had critical concentrations of 110 and 150 mmol/L, respectively. The rate of particle aggregation increased linearly with increasing electrolyte concentration. Heparin 667 units/L had no effect on emulsion stability. The quantity of emulsion in the mixture had a relatively small influence on stability, but higher concentrations exhibited a somewhat greater coalescence. <sup>(892)</sup>

Instability of the emulsion systems is manifested by (1) flocculation of oil droplets to form aggregates that produce a cream-like layer on top or (2) coalescence of oil droplets leading to an increase in the average droplet size and eventually to a separation of free oil. The lowering of pH and adding of electrolytes can adversely affect the mechanical and electrical properties at the oil-water interface, eventually leading to flocculation and coalescence. Amino acids act as buffering agents and provide a protective effect on emulsion stability. Addition of electrolytes, especially the divalent ions  $\text{Mg}^{++}$  and  $\text{Ca}^{++}$  in excess of 2.5 mmol/L, to simple fat emulsions causes flocculation. But in mixed parenteral nutrition solutions, the stability of the emulsion is enhanced, depending on the quantity and nature of the amino acids present. The authors recommended a careful examination of emulsion mixtures for instability prior to administration. <sup>(849)</sup>

The stability of an amino acid 4% (Travenol), dextrose 14%, fat emulsion 4% (Pharmacia) parenteral nutrition solution was reported to be quite good. The solution also contained electrolytes, vitamins, and heparin sodium 4000 units/L. The aqueous solution was prepared first, with the fat emulsion added subsequently. This procedure allowed visual inspection of the aqueous phase and reduced the risk of emulsion breakdown by the divalent cations. Sample mixtures were stored at 18 to 25 and 3 to 8 °C for up to five days. They were evaluated visually and with a Coulter counter for particle size measurements. Both room temperature and refrigerated mixtures were stable for 48 hours. A marked increase in particle size was noted in the room temperature sample after 72 hours, but refrigeration delayed the changes. The authors' experience with over 1400 mixtures for administration to patients resulted in one emulsion creaming and another cracking. The authors had no explanation for the failure of these particular emulsions. <sup>(848)</sup>

Six parenteral nutrition solutions having various concentrations of amino acids, dextrose, soybean oil emulsion (Kabi-Vitrum), electrolytes, and multivitamins were reported. All of the admixtures were stable for one week under refrigeration followed by 24 hours at room temperature, with no visible changes, pH changes, or significant particle size changes. <sup>(1013)</sup> However, other researchers questioned this interpretation of the results. <sup>(1014)</sup> <sup>(1015)</sup>

The stability of 3-in-1 parenteral nutrition solutions prepared with 500 mL of Intralipid 20% compared to Soyacal 20%, along with 500 or 1000 mL of FreAmine III 8.5% and 500 mL of dextrose 70% was reported. Also present were relatively large amounts of electrolytes and other additives. All mixtures were similarly stable for 28 days at 4 °C followed by five days at 21 to 25 °C, with little change in the emulsion. A slight white cream layer appeared after five days at 4 °C, but it was easily dispersed with gentle agitation. The appearance of this cream layer did not statistically affect particle size distribution. The authors concluded that the emulsion mixture remained suitable for clinical use throughout the study period. The stability of other components was not evaluated. <sup>(1019)</sup>

The stability of 3-in-1 parenteral nutrition admixtures prepared with Liposyn II 10 and 20%, Aminosyn pH 6, and dextrose along with electrolytes, trace metals, and vitamins was reported. Thirty-one different combinations were evaluated. Samples were stored under the following conditions: (1) 25 °C for one day, (2) 5 °C for two days followed by 30 °C for one day, or (3) 5 °C for nine days followed by 25 °C for one day. In all cases, there was no visual evidence of creaming, free oil droplets, and other signs of emulsion instability. Furthermore, little or no change in the particle size or zeta potential (electrostatic surface charge of lipid particles) was found, indicating emulsion stability. The dextrose and amino acids remained stable over the 10-day storage period. The greatest change of an amino acid occurred with tryptophan, which lost 6% in 10 days. Vitamin stability was not tested. <sup>(1025)</sup>

The stability of four parenteral nutrition admixtures, ranging from 1 L each of amino acids 5.5% (Travenol), dextrose 10%, and fat emulsion 10% (Travenol) up to a "worst case" of 1 L each of amino acids 10% with electrolytes (Travenol), dextrose 70%, and fat emulsion 10% (Travenol) was reported. The admixtures were stored for 48 hours at 5 to 9 °C followed by 24 hours at room temperature. There were no visible signs of creaming, flocculation, or free oil. The mean emulsion particle size remained within acceptable limits for all admixtures, and there were no significant changes in glucose, soybean oil, and amino acid concentrations. The authors noted that two factors were predominant in determining the stability of such admixtures: electrolyte concentrations and pH. <sup>(1065)</sup>

Several parenteral nutrition solutions containing amino acids (Travenol), glucose, and lipid, with and without electrolytes and trace elements, produced no visible flocculation or any significant change in mean emulsion particle size during 24 hours at room temperature. <sup>(1066)</sup>

The compatibility of 10 parenteral nutrition admixtures, evaluated over 96 hours while stored at 20 to 25 °C in both glass bottles and ethylene vinyl acetate bags, was reported. A slight creaming occurred in all admixtures, but this cream layer was easily dispersed by gentle shaking. No fat globules were visually apparent. The mean drop size was larger in the cream layer, but no globules were larger than 5 µm. Analyses of the concentrations of amino acids, dextrose, and electrolytes showed no changes over the study period. The authors concluded that such parenteral nutrition admixtures can be prepared safely as long as the component concentrations are within the following ranges <sup>(1067)</sup> :

Vamin glucose or Vamin N	1000 to 2000 mL
(amino acids 7%)	
Dextrose 10 to 30%	100 to 550 mL
Intralipid 10 or 20%	500 to 1000 mL

Electrolytes (mmol/L)

Sodium	20 to 70
Potassium	20 to 55
Calcium	2.3 to 2.9
Magnesium	1.1 to 3.1
Phosphorus	0 to 9.2
Chloride	27 to 71
Zinc	0.005 to 0.03

The stability of eight parenteral nutrition admixtures with various ratios of amino acids, carbohydrates, and fat. FreAmine III 8.5%, dextrose 70%, and Soyacal 10 and 20% (mixed in ratios of 2:1:1, 1:1:1, 1:1:(1/2), and 1:1:(1/4), where 1 = 500 mL) was evaluated. Additive concentrations were high to stress the admixtures and represent maximum doses likely to be encountered clinically:

Sodium acetate	150 mEq
Sodium chloride	210 mEq
Potassium acetate	45 mEq
Potassium chloride	90 mEq
Potassium phosphate	15 mM
Calcium gluconate	20 mEq
Magnesium sulfate	36 mEq
Trace elements	present
Folic acid	5 mg
M.V.I.-12	10 mL

The admixtures were stored at 4 °C for 14 days followed by four days at 22 to 25 °C. After 24 hours, all admixtures developed a thin white cream layer, which was readily dispersed by gentle agitation. No free oil droplets were observed. The mean particle diameter remained near the original size of the Soyacal throughout the study. Few particles were larger than 3 µm. Osmolality and pH also remained relatively unchanged.<sup>(1068)</sup>

Parenteral nutrition 3-in-1 admixtures with Aminosyn and Liposyn can be a problem. Standard admixtures were prepared using Aminosyn 7% 1000 mL, dextrose 50% 1000 mL, and Liposyn 10% 500 mL. Concentrated admixtures were prepared using Aminosyn 10% 500 mL, dextrose 70% 500 mL, and Liposyn 20% 500 mL. Vitamins and trace elements were added to the admixtures along with the following electrolytes:

<b>Electrolyte</b>	<b>Standard Admixture</b>	<b>Concentrated Admixture</b>
Sodium	125 mEq	75 mEq
Potassium	95 mEq	74 mEq
Magnesium	25 mEq	25 mEq
Calcium	28 mEq	28 mEq
Phosphate	37 mmol	36 mmol
Chloride	83 mEq	50 mEq

Samples of each admixture were (1) stored at 4 °C, (2) adjusted to pH 6.6 with sodium bicarbonate and stored at 4 °C, or (3) adjusted to pH 6.6 and stored at room temperature. Compatibility was evaluated for three weeks.

Signs of emulsion deterioration were visible by 96 hours in the standard admixture and by 48 hours in the concentrated admixture. Clear rings formed at the meniscus, becoming thicker, yellow, and oily over time. Free-floating oil was obvious in three weeks in the standard admixture and in one week in the concentrated admixture. The samples adjusted to pH 6.6 developed visible deterioration later than the others. The authors indicated that pH may play a greater role than temperature in emulsion stability. However, precipitation (probably calcium phosphate and possibly carbonate) occurred in 36 hours in the pH 6.6 concentrated admixture but not the unadjusted (pH 5.5) samples. Mean particle counts increased for all samples over time but were greatest in the concentrated admixtures. The concentrated admixtures were unsatisfactory for clinical use because of the early increase in particles and precipitation. Furthermore, the standard admixtures should be prepared immediately prior to use.<sup>(1069)</sup>

The physical stability of 10 parenteral nutrition admixtures with different amino acid sources was studied. The admixtures contained 500 mL each of dextrose 70%, fat emulsion 20% (Alpha Therapeutics), and amino acids in various concentrations from each manufacturer. Also present were

standard electrolytes, trace elements, and vitamins. The admixtures were stored for 14 days at 4 °C, followed by four days at 22 to 25 °C. Slight creaming was evident in all admixtures but redispersed easily with agitation. Emulsion particles were uniform in size, showing no tendency to aggregate. No cracked emulsions occurred. <sup>(1217)</sup>

The stability of parenteral nutrition solutions containing amino acids, dextrose, and fat emulsion along with electrolytes, trace elements, and vitamins has been described. In one study the admixtures were stable for 24 hours at room temperature and for eight days at 4 °C. The visual appearance and particle size of the fat emulsion showed little change over the observation periods. <sup>(1218)</sup> In another study variable stability periods were found, depending on electrolyte concentrations. Stability ranged from four to 25 days at room temperature. <sup>(1219)</sup>

The effects of dilution, dextrose concentration, amino acids, and electrolytes on the physical stability of 3-in-1 parenteral nutrition admixtures prepared with Intralipid 10% or Travamulsion 10% was studied. Travamulsion was affected by dilution up to 1:14, exhibiting an increase in mean particle size, while Intralipid remained virtually unchanged for 24 hours at 25 °C and for 72 hours at 4 °C. At dextrose concentrations above 15%, fat droplets larger than 5 µm formed during storage for 24 hours at either 4 °C or room temperature. The presence of amino acids increased the stability of the fat emulsions in the presence of dextrose. Fat droplets larger than 5 µm formed at a total electrolyte concentration above approximately 240 mmol/L (monovalent cation equivalent) for Travamulsion 10% and 156 mmol/L for Intralipid 10% in 24 hours at room temperature, although creaming or breaking of the emulsion was not observed visually. <sup>(1221)</sup>

The stability of 43 parenteral nutrition admixtures composed of various ratios of amino acid products, dextrose 10 to 70%, and four lipid emulsions 10 and 20% with electrolytes, trace elements, and vitamins was studied. One group of admixtures included Travasol 5.5, 8.5, and 10%, FreAmine III 8.5 and 10%, Novamine 8.5 and 11.4%, Nephramine 5.4%, and RenAmine 6.5% with Liposyn II 10 and 20%. In another group, Aminosyn II 7, 8.5, and 10% was combined with Intralipid, Travamulsion, and Soyacal 10 and 20%. A third group was comprised of Aminosyn II 7, 8.5, and 10% with electrolytes combined with the latter three lipid emulsions. The admixtures were stored for 24 hours at 25 °C and for nine days at 5 °C followed by 24 hours at 25 °C. A few admixtures containing FreAmine III and Novamine with Liposyn II developed faint yellow streaks after 10 days of storage. The streaks readily dispersed with gentle shaking, as did the creaming present in most admixtures. Other properties such as pH, zeta-potential, and osmolality underwent little change in all of the admixtures. Particle size increased fourfold in one admixture (Novamine 8.5%, dextrose 50%, and Liposyn II in a 1:1:1 ratio), which the authors noted signaled the onset of particle coalescence. Nevertheless, the authors concluded that all of the admixtures were stable for the storage conditions and time periods tested. <sup>(1222)</sup>

The stability of 24 parenteral nutrition admixtures composed of various ratios of Aminosyn II 7, 8.5, or 10%, dextrose, and Liposyn II 10 and 20% with electrolytes, trace elements, and vitamins was also studied. Four admixtures were stored for 24 hours at 25 °C, six admixtures were stored for two days at 5 °C followed by one day at 30 °C, and 14 admixtures were stored for nine days at 5 °C followed by one day at 25 °C. No visible instability was evident. Creaming was present in most admixtures but disappeared with gentle shaking. Other properties such as pH, zeta-potential, particle size, and concentrations of the amino acids and dextrose showed little or no change during storage. <sup>(1223)</sup>

The emulsion stability of five parenteral nutrition formulas (TNA #126 through #130 in Appendix I) containing Liposyn II in concentrations ranging from 1.2 to 7.1% were reported. The parenteral nutrition solutions were prepared using simultaneous pumping of the components into empty containers (as with the Nutrimix compounder) and sequential pumping of the components (as with Automix compounders). The solutions were stored for two days at 5 °C followed by 24 hours at 25 °C. Similar results were obtained for both methods of preparation using visual assessment and oil globule size distribution. <sup>(1426)</sup>

The stability of 24 parenteral nutrition admixtures containing various concentrations of Aminosyn II, dextrose, and Liposyn II with a variety of electrolytes, trace elements, and multivitamins in dual-chamber, flexible, Nutrimix containers was studied as well. No instability was visible in the

admixtures stored at 25 °C for 24 hours or in those stored for nine days at 5 °C followed by 24 hours at 25 °C. Creaming was observed, but neither particle coalescence nor free oil was noted. The pH, particle size distribution, and amino acid and dextrose concentrations remained acceptable during the observation period. <sup>(1432)</sup>

The physical stability of 10 parenteral nutrition formulas (TNA #149 through #158 in Appendix I) containing TrophAmine and Intralipid 20%, Liposyn II 20%, and Nutrilipid 20% in varying concentrations with low and high electrolyte concentrations was studied. All test formulas were prepared with an automatic compounder and protected from light. TNA #149 through #156 were stored for 48 hours at 4 °C followed by 24 hours at 21 °C; TNA #157 and #158 were stored for 24 hours at 4 °C followed by 24 hours at 21 °C. Although some minor creaming occurred in all formulas, it was completely reversible with agitation. No other changes were visible, and particle size analysis indicated little variation during the study period. The addition of cysteine hydrochloride 1 g/25 g of amino acids, alone or with l-carnitine 16 mg/g fat, to TNA #157 and #158 did not adversely affect the physical stability of 3-in-1 admixtures within the study period. <sup>(1620)</sup>

The physical stability of five 3-in-1 parenteral nutrition admixtures (TNA #167 through #171 in Appendix I) was evaluated by visual observation, pH and osmolality determinations, and particle size distribution analysis. All five admixtures were physically stable for 90 days at 4 °C. However, some irreversible flocculation occurred in all combinations after 180 days. <sup>(1651)</sup>

The stability of several parenteral nutrition formulas (TNA #159 through #166 in Appendix I), with and without iron dextran 2 mg/L was studied. All formulas were physically compatible both visually and microscopically for 48 hours at 4 and 25 °C, and particle size distribution remained unchanged. The order of mixing and deliberate agitation had no effect on physical compatibility. <sup>(1648)</sup>

The maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix I) was reported. Added calcium varied from 1.5 to 150 mmol/L, while added phosphate varied from 21 to 300 mmol/L. The mixtures were stable for 48 hours at 22 and 37 °C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mM/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup>. <sup>(1773)</sup>

The influence of six factors on the stability of fat emulsion in 45 different 3-in-1 parenteral nutrition mixtures was evaluated. The factors were amino acid concentration (2.5 to 7%); dextrose (5 to 20%); fat emulsion, intravenous (2 to 5%); monovalent cations (0 to 150 mEq/L); divalent cations (4 to 20 mEq/L); and trivalent cations from iron dextran (0 to 10 mg elemental iron/L). Although many formulations were unstable, visual examination could identify instability in only 65% of the samples. Electronic evaluation of particle size identified the remaining unstable mixtures. Furthermore, only the concentration of trivalent ferric ions significantly and consistently affected the emulsion stability during the 30-hour test period. Of the parenteral nutrition mixtures containing iron dextran, 16% were unstable, exhibiting emulsion cracking. The authors suggested that iron dextran should not be incorporated into 3-in-1 mixtures. <sup>(1814)</sup>

The compatibility of eight parenteral nutrition admixtures, four with and four without electrolytes, comparing Liposyn II and Intralipid (TNA #250 through #257 in Appendix I) was reported. The 3-in-1 admixtures were evaluated over two to nine days at 4 °C and then 24 hours at 25 °C in ethylene vinyl acetate (EVA) bags. No substantial changes were noted in the fat particle sizes and no visual changes of emulsion breakage were observed. All admixtures tested had particle sizes in the 2- to 40- $\mu$ m range. <sup>(2465)</sup>

The stability of 3-in-1 parenteral nutrition admixtures prepared with Vamin 14 with electrolytes and containing either Lipofundin MCT/LCT 20% or Intralipid 20% was evaluated. The admixtures contained 66.7 mmol/L of monovalent and 6.7 mmol/L of divalent cations. Stability of the fat emulsion was evaluated after 2, 7, and 21 days at 4 °C in EVA bags followed by 24 hours of room temperature to simulate infusion. Microscopy, Coulter counter, photon correlation spectroscopy, and laser diffractometry techniques were used to determine stability. Droplet size by microscopy was noted to increase to 18 to 20  $\mu$ m after 21 days in both of the admixtures with the Intralipid-

containing admixture showing particles this large as early as day 2 and with Lipofundin MCT/LCT at day 7. The Coulter counter assessed particles greater than 2 µm to be approximately 1300 to 1500 with Lipofundin MCT/LCT and 37,000 in the Intralipid-containing admixtures immediately after their preparation. Heavy creaming with a thick firm layer was noted after 2 days with the Intralipid-containing admixture, making particle assessment difficult. The authors concluded that storage limitation of two days for the Intralipid-containing admixture and not more than seven days for the Lipofundin-containing admixture appeared justified. They also noted that calcium and magnesium behaved identically in destabilizing fat emulsion with greater concentrations of divalent cations. <sup>(867)</sup>

The physical instability of 3-in-1 total nutrient admixtures stored for 24 hours at room temperature was reported. The admixtures intended for use in neonates and infants were compounded with TrophAmine 2 to 3%, dextrose 18 to 24%, Liposyn II (Abbott) 2 to 3%, l-cysteine hydrochloride, and the following electrolytes:

Sodium	20 to 50 mEq/L
Potassium	13.3 to 40 mEq/L
Calcium chloride	20 to 26.6 mEq/L
Magnesium	3.4 to 5 mEq/L
Phosphates	6.7 to 15 mmol/L

The emulsion in the admixtures cracked and developed visible free oil within 24 hours after compounding. The incompatibility was considered to create a clinically significant risk of complications if the admixture was administered. The authors determined that these 3-in-1 total nutrient admixtures containing these concentrations of electrolytes were unacceptable and should not be used. <sup>(2619)</sup>

Another evaluation of 3-in-1 total nutrient admixtures reported physical instabilities of several formulations evaluated over seven days. The parenteral nutrition admixtures were prepared with dextrose 15%, and Intralipos 4% (Fresenius Kabi) along with FreAmine 4.3%, NephroAmine 2.1%, TrophAmine 2.7%, Topanusol 5%, or HepatAmine 4%. Various electrolytes and other components were also present including sodium, potassium, calcium (salt form unspecified), magnesium, trace elements, vitamin K, and heparin. The admixtures were stored at 4 °C and evaluated at zero, three, and seven days. After removal from refrigeration, the samples were subjected to additional exposure to room temperature and temperatures exceeding 28 °C for 24 to 48 hours. Flocculation was found in the admixtures prepared with FreAmine and with TrophAmine after 24 hours of storage at room temperature and after three days under refrigeration followed by 24 hours at room temperature. All of the admixtures developed coalescence after seven days under refrigeration followed by 24 hours at greater than 28 °C. <sup>(2621)</sup>

The physical stability of five highly concentrated 3-in-1 parenteral nutrition admixtures for fluid-restricted adults was evaluated. The admixtures were composed of Aminoplasmal (B. Braun) at concentrations over 7% as the amino acids source, dextrose concentrations of about 20%, and a 50:50 mixture of medium-chain triglycerides and long-chain triglycerides (Lipofundin MCT, B. Braun) at concentrations of about 2.5 to 2.7% as the lipid component with electrolytes and vitamins (TNA #269 through #273 in Appendix I). The parenteral nutrition admixtures were prepared in ethylene vinyl acetate bags and stored at room temperature for 30 hours. Electronic evaluation of mean fat particle sizes and globule size distribution found little change over the 30-hour test period. <sup>(2721)</sup>

The drop size of 3-in-1 parenteral nutrition solutions in drip chambers is variable, being altered by the constituents of the mixture. In one study, multivitamins (Multibionta, E. Merck) caused the greatest reductions in drop size, up to 37%. This change may affect the rate of delivery if flow is estimated from drops per minute. <sup>(1016)</sup> Similarly, flow rates delivered by infusion controllers dependent on predictable drop size may be inaccurate. Flow rates up to 29% less than expected have been reported. Therefore, variable-pressure volumetric pumps, which are independent of drop size, should be used rather than infusion controllers. <sup>(1215)</sup>

When using multicomponent, 3-in-1, parenteral nutrition admixtures, the following points should be considered <sup>(490) (703) (892) (893) (1025) (1064) (1070) (1214) (1324) (1406) (1670) (2215) (2282) (2308)</sup> ;

1. The order of mixing is important. The amino acid solution should be added to either the fat emulsion or the dextrose before final mixing. This practice ensures that the protective effect of the amino acids to emulsion disruption by changes in pH and the presence of electrolytes is realized.
2. Electrolytes should not be added directly to the fat emulsion. Instead, they should be added to the amino acids or dextrose before the final mixing.
3. Such 3-in-1 admixtures containing electrolytes (especially divalent cations) are unstable and will eventually aggregate. The mixed systems should be carefully examined visually before use to ensure that a uniform emulsion still exists.
4. Avoid contact of 3-in-1 parenteral nutrition admixtures with heparin, which destabilizes and damages the fat emulsion upon contact.
5. The admixtures should be stored under refrigeration if not used immediately.
6. The ultimate stability of the admixtures will be the result of a complex interaction of pH, component concentrations, electrolyte concentrations, and, probably, storage temperature.

Furthermore, the use of a 1.2- $\mu$ m filter to remove large lipid particles, electrolyte precipitates, other solid particulates, aggregates, and *Candida albicans* contaminants has been recommended<sup>(1106) (1657) (1769) (2061) (2135) (2346)</sup>, although others recommend a 5- $\mu$ m filter to minimize the frequency of occlusion alarms.<sup>(569) (1951)</sup>

*Heparin* — Heparin sodium has been stated to be compatible in fat emulsion.<sup>(480) (660)</sup> The addition of heparin sodium (Abbott) 1 and 2 units/mL to Liposyn 10% and Intralipid 10% did not break the emulsion and effectively reversed the blood hypercoagulability associated with intravenous fat emulsion administration.<sup>(568)</sup>

However, flocculation of fat emulsion (Kabi-Vitrum) has been reported during Y-site administration into a line used to infuse a parenteral nutrition solution containing both calcium gluconate and heparin sodium. Subsequent evaluation indicated that the combination of calcium gluconate (0.46 and 1.8 mmol/125 mL) and heparin sodium (25 and 100 units/125 mL) in amino acids plus dextrose induced flocculation of the fat emulsion within two to four minutes at concentrations that resulted in no visually apparent flocculation in 30 minutes with either agent alone.<sup>(1214)</sup>

Calcium chloride quantities of 1 to 20 mmol normally result in slow flocculation of fat emulsion 20% over several hours. When heparin sodium 5 units/mL was added, the flocculation rate was accelerated greatly and a cream layer was observed visually in a few minutes. This effect was not observed when sodium ion was substituted for the divalent calcium.<sup>(1406)</sup>

Similar results were observed during simulated Y-site administration of heparin sodium into nine 3-in-1 nutrient admixtures having different compositions. Damage to the fat emulsion component was found to occur immediately, with the possible formation of free oil over time.<sup>(2215)</sup>

The destabilization of fat emulsion (Intralipid 20%) when administered simultaneously with a TPN admixture and heparin was observed. The damage, detected by viscosity measurement, occurred immediately upon contact at the Y-site. The extent of the destabilization was dependent on the concentration of heparin and the presence of MVI Pediatric with its surfactant content. Additionally, phase separation was observed in two hours. The authors noted that TPN admixtures containing heparin should never be premixed with fat emulsion as a 3-in-1 total nutrient admixture because of this emulsion destabilization. The authors indicated their belief that the damage could be minimized during Y-site co-administration as long as the heparin was kept at a sufficiently low concentration (no visible separation occurred at a heparin concentration of 0.5 unit/mL) and the length of tubing between the Y-site and the patient was minimized.<sup>(2282)</sup>

However, because the damage to emulsion integrity has been found to occur immediately upon mixing with heparin in the presence of the calcium ions in TPN admixtures<sup>(1214) (2215) (2282)</sup> and no evaluation and documentation of the clinical safety of using such destabilized emulsions has been performed, use of such damaged emulsions in patients is suspect.

*Amphotericin B* — In an effort to reduce toxicity, amphotericin B has been admixed in Intralipid instead of the more usual dextrose 5%.<sup>(1809) (1810) (1811) (2178)</sup> However, amphotericin B 0.75 mg/kg/day administered using this approach in 250 mL of Intralipid 20% has been associated with acute pulmonary toxicities, including sudden onset of coughing, tachypnea, agitation, cyanosis, and deterioration of oxygen saturation. The temporal relationship between the drug administration and respiratory symptoms suggested a causal relationship. Furthermore, no reduction in renal toxicity or other side effects associated with amphotericin B was observed. The authors concluded amphotericin B should not be administered to patients in Intralipid.<sup>(2177)</sup>

At a concentration of 0.6 mg/mL in Intralipid 10 or 20%, amphotericin B precipitated immediately or almost immediately. The precipitate was not visible to the unaided eye because of the emulsion's dense opacity. Particle size evaluation found thousands of particles larger than 10 µm per milliliter. In dextrose 5%, very few particles were larger than 10 µm. Centrifuging the Intralipid admixtures resulted in rapid visualization of the precipitate as a mass at the bottom of the test tubes.<sup>(1808)</sup>

However, amphotericin B precipitation is observed in fat emulsion within two to four hours without centrifuging. In concentrations ranging from 90 mg/L to 2 g/L in Intralipid 20%, amphotericin precipitate is easily seen as yellow particulate matter on the bottom of the lipid emulsion containers.<sup>(1872) (1988)</sup> Damage to the emulsion integrity with creaming has also been reported.<sup>(1987)</sup>

In other reports, the appearance of problems was observed in as little as 15 minutes, and actual amphotericin B precipitate formed within 20 minutes of mixing. Analysis of the precipitate confirmed its identity as amphotericin B. The authors hypothesized that amphotericin B precipitates because the excipient deoxycholic acid, an anion, attracts oppositely charged choline groups from the egg yolk components of the fat emulsion and forms a precipitate with phosphatidylcholine, leaving insufficient surfactant to keep the amphotericin B dispersed.<sup>(2204) (2205)</sup>

*Plasma Expanders* — Fat emulsion (Abbott) 10 and 20% were combined with the plasma expanders Macrodex 6% in sodium chloride 0.9% (Schiwa), Gelafundin (Braun), Haes Steril 10% (Fresenius), and Expafusin Sine (Pfrimmer); fat particles exceeding 5 µm resulted, as observed by microscopic examination. These combinations were incompatible.<sup>(1668)</sup>

Fat Emulsion, Intravenous - AHFS 40:20

## Fenoldopam Mesylate - AHFS 24:08.20

**Products** — Fenoldopam mesylate is available as a concentrated solution in 1- and 2-mL sizes; each milliliter contains fenoldopam 10 mg (as mesylate), propylene glycol 518 mg, citric acid 3.44 mg, sodium citrate dihydrate 0.61 mg, and sodium metabisulfite. The contents must be diluted for use. <sup>(1-3/05)</sup>

**Trade Name(s)** — Corloпам

**Administration** — Fenoldopam mesylate is administered by continuous intravenous infusion only after dilution in dextrose 5% or sodium chloride 0.9% and preferably using a controlled delivery infusion pump capable of delivering the desired infusion rate. A concentration of 40 mcg/mL is recommended for administration. Bolus doses should not be given. <sup>(1-3/05)</sup>

**Stability** — Intact ampuls should be stored between 2 and 30 °C (refrigerated or at room temperature). After dilution in dextrose 5% or sodium chloride 0.9%, fenoldopam mesylate is stated to be stable for at least 24 hours under normal ambient light and temperature. Unused solutions should be discarded after 24 hours. <sup>(1-3/05)</sup>

### Compatibility Information

#### Solution Compatibility

##### Fenoldopam mesylate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	AB <sup>a</sup>	AB	4, 8, 40, 80, 200, 300 mg	Physically compatible. Little loss in 72 hr at 4 °C in dark and at 23 °C in light	2369	C
Sodium chloride 0.9%	AB <sup>a</sup>	AB	4, 8, 40, 80, 200, 300 mg	Physically compatible. Little loss in 72 hr at 4 °C in dark and at 23 °C in light	2369	C

<sup>a</sup>Tested in PVC containers.

Verapamil HCl	AB	1.25 mg/mL <sup>b</sup>	AB	80 mcg/mL <sup>b</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2467</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Concentration expressed in milligrams of phenytoin sodium equivalents (PE) per milliliter.

<sup>d</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>e</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>f</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with

tazobactam sodium.

<sup>g</sup>Quinupristin and dalbapristin components combined.

<sup>h</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

Fenoldopam Mesylate - AHFS 24:08.20

## Fentanyl Citrate - AHFS 28:08.08

**Products** — Fentanyl citrate is available in 2-, 5-, 10-, and 20-mL ampuls, 2- and 5-mL syringe cartridges, and 30- and 50-mL vials. Each milliliter contains fentanyl (as the citrate) 50 mcg (0.05 mg) with hydrochloric acid and/or sodium hydroxide for pH adjustment. <sup>(1-1/08)</sup> (4)

*pH* — From 4 to 7.5. <sup>(1-1/08)</sup> (4)

*Osmolality* — The product osmolality was determined to be essentially 0 mOsm/kg. <sup>(1233)</sup>

*Trade Name(s)* — Sublimaze

**Administration** — Fentanyl citrate is administered by intramuscular or intravenous injection. <sup>(1-1/08)</sup>

**Stability** — Intact containers should be stored at controlled room temperature and protected from light. Brief exposure to temperatures up to 40 °C does not affect concentration. <sup>(1-1/08)</sup> (4)

*pH Effects* — Fentanyl citrate is most stable at pH 3.5 to 7.5. <sup>(1638)</sup> Fentanyl is hydrolyzed in acidic solutions. <sup>(4)</sup>

*Syringes* — Undiluted fentanyl citrate 50 mcg/mL was tested for stability in polypropylene syringes. The fentanyl citrate injection was filled into polypropylene syringes that were then capped off. The samples were stored for 28 days under refrigeration at 5 °C and at room temperature of 22 °C exposed to light. No change in color or clarity occurred. No loss of fentanyl citrate at either set of storage conditions occurred. <sup>(2648)</sup>

Fentanyl citrate (Elkins Sinn) 0.0167 mg/mL in sodium chloride 0.9% packaged in polypropylene syringes (Sherwood) was physically stable and exhibited little or no loss in 24 hours stored at 4 or 23 °C in the dark. <sup>(2199)</sup>

Fentanyl citrate (David Bull) 12.5 mcg/mL in sodium chloride 0.9% was packaged as 8 mL in 10-mL polypropylene syringes (Terumo) with attached needles. Fentanyl citrate (David Bull) 33.3 mcg/mL in sodium chloride 0.9% was packaged as 18 mL in 20-mL polypropylene syringes (Terumo) with attached needles. The syringes were stored at 5, 22, and 38 °C for seven days. The solutions were visually unchanged with no loss of drug at 5 and 22 °C. At 38 °C, the 12.5-mcg/mL solution had under 7% loss and the 33.3-mcg/mL solution had no loss. <sup>(2202)</sup>

Fentanyl citrate (Janssen) 35 mcg/mL in sodium chloride 0.9% was packaged in two types of polypropylene syringes. The Omnifix (B. Braun) syringes had polyisoprene piston tips while the Terumo syringes had no natural or synthetic rubber in the product. Stored at 4, 21, and 35 °C for 30 days, the test solutions exhibited no visible or pH changes. Although the pH remained within the stability range for the drug, this does not demonstrate stability. <sup>(2387)</sup>

Fentanyl citrate (Hospira) was diluted to a concentration of 5 mcg/mL in sodium chloride 0.9% and packaged as 1.1 mL in 12-mL polypropylene syringes (Terumo). <sup>(2791)</sup> The syringes were stored for 90 days at a controlled temperature of 23 to 27°C and relative humidity of 55 to 65% while being protected from light. <sup>(2791)</sup> Neither changes in color or clarity nor appreciable changes in pH from baseline values occurred. <sup>(2791)</sup> Samples exhibited a loss of less than 1% at 90 days. <sup>(2791)</sup>

*Ambulatory Pumps* — Fentanyl citrate (Merck) 50 and 30 mcg/mL in sodium chloride 0.9% was evaluated in CADD-1 and CADD-PRIZM medication cassettes. About 4% drug loss occurred in 14 days at room and refrigeration temperatures. <sup>(2717)</sup>

*Sorption* — Fentanyl citrate 2 mcg/mL in various buffer solutions ranging from pH 5.5 to pH 6.7

packaged in PVC containers (Baxter) was shown to undergo slow sorption to the PVC in amounts dependent on the pH of the solution. The lower pH solutions exhibited less loss with increasing loss as the pH increased. At the highest pH tested of 6.7, 17% fentanyl loss occurred in one day. Refrigeration decreased the extent of loss but did not eliminate it. See Table 1. Little or no fentanyl loss was found in identical fentanyl citrate 2-mcg/mL solutions packaged in glass containers. <sup>(2305)</sup>

Undiluted fentanyl citrate 50 mcg/mL was tested for stability in PVC bags. The fentanyl citrate injection was filled into PVC bags that were stored for 28 days under refrigeration at 5 °C and at room temperature of 22 °C exposed to light. No change in color or clarity occurred. No loss of fentanyl citrate at either set of storage conditions occurred. <sup>(2648)</sup>

**Table 1. Percentage of Fentanyl Citrate 2 mcg/mL Remaining After Storage for 30 Days at 23 °C in PVC Containers** <sup>2305</sup>

Buffer pH	Fentanyl Remaining (%)
5.5	85
5.8	77
6.3	56
6.7	27

*Filtration* — Fentanyl citrate (Janssen) 2.5 mcg/mL in dextrose 5% or sodium chloride 0.9% was delivered over four hours through three kinds of 0.2-µm membrane filters varying in size and composition. No fentanyl loss occurred due to sorption to the filter. <sup>(1399)</sup>

*Central Venous Catheter* — Fentanyl citrate (Abbott) 10 mcg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

**Compatibility Information**

Epinephrine HCl	AB <sup>k</sup>	0.69 mg	JN	1.25 mg	e	No bupivacaine and fentanyl loss and 10% epinephrine loss in 30 days at 3 and 23 °C then 48 hr at 30 °C	<a href="#">1627</a>	C
Fluorouracil	AB	1 and 16 g	AB	12.5 mg	D5W, NS <sup>a</sup>	25% fentanyl loss in 15 min due to sorption to PVC	<a href="#">2064</a>	I
Ketamine HCl with droperidol	JN JN	1 g 50 mg	DB	10 mg	NS <sup>a</sup>	Visually compatible. 5% increase in all drugs in 30 days at 4 and 25 °C due to water loss	<a href="#">2653</a>	C
Ketamine HCl with droperidol	JN JN	1 g 50 mg	DB	10 mg	NS <sup>d</sup>	Visually compatible with little loss of the drugs in 30 days at 25 °C	<a href="#">2653</a>	C
Lidocaine HCl	AST	2.5 g		2 mg	NS <sup>a</sup>	Physically compatible with no loss of lidocaine or fentanyl at pH 5.8 in 30 days at 4 and 23 °C	<a href="#">2305</a>	C
Lidocaine HCl	BRN	2.5 g		2 mg	NS <sup>a</sup>	Physically compatible with little lidocaine loss but 18% fentanyl loss at 23 °C and 10% loss at 4 °C in 2 days due to sorption at pH 6.7 from higher pH lidocaine	<a href="#">2305</a>	I

Ropivacaine HCl	ASZ	1 g	JN	1 mg	NS <sup>b</sup>	product Physically compatible. No loss of either drug in 30 days at 30 °C in the dark	<a href="#">2433</a>	C
Ropivacaine HCl	ASZ	2 g	JN	1 and 10 mg	<sup>b</sup>	Physically compatible. No loss of either drug in 30 days at 30 °C in the dark	<a href="#">2433</a>	C
Ropivacaine HCl	ASZ	1.5 g	CUR	3 mg	NS <sup>c</sup>	Physically compatible. No loss of either drug in 51 days at 20 and 4 °C	<a href="#">2498</a>	C
Ropivacaine HCl	ASZ	1.5 g	CUR	3 mg	NS <sup>a</sup>	Physically compatible. No loss of either drug in 7 days at 20 and 4 °C	<a href="#">2498</a>	C
Ziconotide acetate	ELN	25 mg <sup>b</sup>	BB	1 g <sup>f</sup>		10% ziconotide loss in 26 days. No fentanyl loss in 40 days at 37 °C	<a href="#">2772</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polypropylene bags (Mark II Polybags).

<sup>c</sup>Tested in glass and ethylene vinyl acetate containers.

<sup>d</sup>Tested in glass containers.

<sup>e</sup>Tested in portable infusion pump reservoirs (Pharmacia Deltec).

<sup>f</sup>Fentanyl citrate powder dissolved in ziconotide acetate injection.

<sup>g</sup>Tested with clonidine HCl (BI) 9 mg.

<sup>h</sup>Tested with epinephrine HCl (AB) 0.69 mg.

<sup>i</sup>Tested with epinephrine bitartrate 2 mg.

<sup>j</sup>Tested with bupivacaine HCl (AST) 1 g.

<sup>k</sup>Tested with bupivacaine HCl (WI) 440 mg.

<sup>l</sup>Tested with bupivacaine HCl (IVX) 1 g.

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in dextrose 5% in sodium chloride 0.9%.

<sup>d</sup>Flowing at 1.6 mL/min.

<sup>e</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection lactated, dextrose 5%, Ringer's injection lactated, and sodium chloride 0.9%.

<sup>f</sup>Tested with albumin human 0.1%.

<sup>g</sup>Tested in sterile water for injection.

<sup>h</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>i</sup>Injected via Y-site into an administration set running azithromycin.

<sup>j</sup>Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>k</sup>Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>l</sup>Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix I).

<sup>m</sup>Tested in Ringer's injection lactated.

## Filgrastim - AHFS 20:16

**Products** — Filgrastim is available in 300-mcg and 480-mcg sizes with the product compositions and package configurations shown in Table 1. <sup>(1-9/07)</sup>

**Table 1. Filgrastim Products and Compositions** <sup>1-9/07</sup>

	<b>300 mcg/1-mL Vial</b>	<b>480 mcg/1.6-mL Vial</b>	<b>300 mcg/0.5-mL Syringe</b>	<b>480 mcg/0.8-mL Syringe</b>
Filgrastim	300 mcg	480 mcg	300 mcg	480 mcg
Acetate	0.59 mg	0.94 mg	0.295 mg	0.472 mg
Sorbitol	50 mg	80 mg	25 mg	40 mg
Polysorbate 80	0.004%	0.004%	0.004%	0.004%
Sodium	0.035 mg	0.056 mg	0.0175 mg	0.028 mg
Water for injection qs	1 mL	1.6 mL	0.5 mL	0.8 mL

*pH* — 4. <sup>(4)</sup>

*Trade Name(s)* — Neupogen

**Administration** — Filgrastim is administered by subcutaneous injection undiluted or by intravenous or subcutaneous infusion. For intravenous infusion, it is diluted in 50 to 100 mL of dextrose 5% and given over 15 to 30 or 60 minutes or over 24 hours by continuous infusion. It may also be given over 24 hours by continuous subcutaneous infusion after diluting the dose in 10 to 50 mL of dextrose 5% and infusing at a rate not exceeding 10 mL/24 hours. For extended infusions by either route, a controlled-infusion device is used. For filgrastim concentrations of 5 to 15 mcg/mL albumin human should be added to the solution at a final concentration of 0.2% (2 mg/mL) before the filgrastim is added. The drug should not be diluted to concentrations less than 5 mcg/mL. <sup>(1-9/07)</sup> <sup>(4)</sup>

**Stability** — Filgrastim injection is a clear, colorless solution. Intact containers should be refrigerated at 2 to 8 °C and protected from direct sunlight. The product also should be protected from freezing and temperatures above 30 °C to avoid aggregation. The solution should not be shaken since bubbles and/or foam may form. If foaming occurs, the solution should be left undisturbed for a few minutes until bubbles dissipate. <sup>(1-9/07)</sup> <sup>(4)</sup>

Although refrigerated storage is required, the manufacturer has stated that filgrastim may be stored at room temperature for 24 hours <sup>(1-9/07)</sup> <sup>(4)</sup>, while others have stated that the drug is stable for seven days at room temperature. <sup>(2745)</sup> The product is packaged in single-use containers with no antibacterial preservative. The manufacturer recommends that vials not be reentered and that unused portions be discarded. <sup>(1-9/07)</sup>

Filgrastim dilutions in dextrose 5% prepared for infusion should be stored under refrigeration and used within 24 hours of preparation because of concern about possible bacterial contamination. <sup>(1-9/07)</sup> <sup>(4)</sup>

*pH Effects* — Filgrastim is stable at pH 3.8 to 4.2, but stability is limited at neutral pH. <sup>(4)</sup>

*Syringes* — Undiluted filgrastim is stable for 24 hours at 15 to 30 °C and for seven days refrigerated at 2 to 8 °C repackaged in tuberculin syringes (Becton-Dickinson). However, refrigeration and use within 24 hours are recommended because of concern about bacterial contamination. <sup>(4)</sup>

Although studies have found filgrastim in syringes remained sterile stored under refrigeration, <sup>(1764)</sup> <sup>(2186)</sup> the sterility of repackaged injections is a function of the quality of the specific aseptic process of packaging, the quality of the environment in which the sterile product is packaged, and the

capability of the personnel involved rather than a property of this unpreserved injection. Consequently, sterility is only valid for the specific facilities and operators for that specific test. The adequacy and safety of repackaging in another location or with other individuals or on another occasion should be verified independently for each institution and batch of repackaged filgrastim injection. Each institution needs to establish specific validation testing results for its own aseptic processing facilities, equipment, procedures, and personnel. (1765) (2187) The potential for microbiological growth should be considered when assigning expiration periods.

The sterility of filgrastim 0.2 mL (60 mcg) extemporaneously drawn aseptically into tuberculin syringes and kept under "patient use" storage conditions was evaluated. The syringes were sent home with patients to be stored in their home refrigerators for seven days and then were returned for sterility testing. A contamination rate as high as 1.25% was reported. The authors expressed the opinion and hope that the high rate of contamination was an artifact of the sterility testing itself. However, contamination during storage in the patients' refrigerators may have occurred. (2294)

**Sorption** — Filgrastim in dextrose 5% at concentrations above 15 mcg/mL and between 2 and 15 mcg/mL with added albumin human 0.2% is compatible with common plastics used in syringes, administration sets, solution containers, and pump cassettes including PVC, polyolefin, and polypropylene. (4)

Filgrastim sorption occurs to a greater extent with lower concentrations and with longer infusion tubing. (2601) For filgrastim concentrations between 5 and 15 mcg/mL, albumin human should be added before adding the filgrastim to make a final albumin human concentration of 0.2% (2 mg/mL) to minimize filgrastim adsorption to infusion containers and equipment. At filgrastim concentrations above 15 mcg/mL, albumin human is unnecessary. The product should not be diluted to a final concentration of less than 5 mcg/mL. (1-9/07) (4)

The amount of loss of filgrastim (Amgen) from the undiluted injection at a concentration of 300 mcg/mL when delivered through 6.6-French, single-lumen, silicone rubber, Broviac catheters (Bard) was evaluated. The catheters were filled with dextrose 5% (about 0.45 mL) and flushed before and after introduction of the filgrastim. Injected amounts of filgrastim 300 mcg/mL ranged from 0.17 to 1 mL. The delivered flush solution was collected and analyzed for filgrastim content and activity. The lowest volume (0.17 mL) incurred about 32% loss of filgrastim upon delivery. The other volumes incurred lower losses, ranging from 12% to none. A second repeat filgrastim injection incurred similar losses. The filgrastim that was delivered through the catheters remained active. (2017)

## Compatibility Information

### Solution Compatibility

#### Filgrastim

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%		AMG	5 mcg/mL or more <sup>a</sup>	Use within 24 hours	1(9/07)	C
Dextrose 5%		AMG	2 mcg/mL or more <sup>a</sup>	Stable for 7 days at 4 °C	4	C
Sodium chloride 0.9%		AMG		Physically incompatible	1(9/07)	I

<sup>a</sup>Concentrations between 5 and 15 mcg/mL require human albumin 2 mg/mL.

### Y-Site Injection Compatibility (1:1 Mixture)

## Floxacillin Sodium (FLUCLOXACILLIN SODIUM) - AHFS 8:12.16.12

**Products** — Floxacillin sodium is available in vials containing 250 mg, 500 mg, and 1 g of floxacillin as the sodium salt. To reconstitute for intramuscular use, add 1.5 mL of sterile water for injection to the 250-mg vial, 2 mL to the 500-mg vial, or 2.5 mL to the 1-g vial. <sup>(38)</sup> <sup>(115)</sup>

For intravenous use, reconstitute the 250- or 500-mg vial with 5 to 10 mL and the 1-g vial with 15 to 20 mL of sterile water for injection. For intravenous infusion, the solution may be diluted further in a compatible infusion fluid. <sup>(38)</sup> <sup>(115)</sup>

For intrapleural use, reconstitute the 250-mg vial with 5 to 10 mL of sterile water for injection. For intra-articular use, reconstitute the 250- or 500-mg vial with up to 5 mL of sterile water for injection or lidocaine hydrochloride 0.5% injection. <sup>(38)</sup> <sup>(115)</sup>

For smaller doses, the reconstitution volumes in Table 1 will yield the indicated concentrations.

**Table 1. Floxacillin Reconstitution Volumes for Smaller Doses** <sup>38</sup> <sup>115</sup>

Vial Size	Concentration (mg/1 mL)					
	50	100	125	200	250	500
250 mg	4.8 mL	2.3 mL	1.8 mL	1.05 mL		
500 mg		4.7 mL	3.7 mL	2.2 mL	1.7 mL	
1 g		9.3 mL			3.3 mL	1.3 mL

**Sodium and Magnesium Content** — Each gram of drug contains 2.2 mmol (51 mg) of sodium and 1 mmol of magnesium. <sup>(38)</sup> <sup>(89)</sup> <sup>(115)</sup>

**Trade Name(s)** — Floxapen, Ladropen

**Administration** — Floxacillin sodium may be administered by intramuscular injection, direct intravenous injection slowly over three to four minutes, continuous intravenous infusion, and intrapleural and intra-articular injection. <sup>(38)</sup>

**Stability** — Floxacillin sodium in intact vials should be stored below 25 °C. The injection reconstituted for intramuscular or direct intravenous injection should be freshly prepared and administered within 30 minutes. However, reconstituted floxacillin sodium injection is stated to be stable for 24 hours when stored under refrigeration. <sup>(38)</sup> <sup>(115)</sup>

Losses of 8% in three days were reported for reconstituted solutions containing floxacillin sodium (Beecham) 100 mg/mL stored at 20 to 25 °C. <sup>(89)</sup>

**Freezing Solutions** — Floxacillin sodium (Beecham) 20 mg/mL in sodium chloride 0.9% or dextrose 5% in PVC bags (Travenol) retained greater than 90% after being frozen and stored at -27 °C for up to 270 days. Thawing by microwave radiation and subsequent storage for 24 hours at 4 °C did not cause drug loss below 90% of the stated concentration. However, a distinct yellow discoloration was produced after 90 days of storage, rendering the solutions unacceptable. <sup>(1176)</sup>

Floxacillin sodium (Beecham) 1 g in 50 mL of sodium chloride 0.9% or dextrose 5% in PVC bags (Travenol) was stored at -20 °C for 30 days, followed by natural thawing and storage at 5 °C for 21 hours. The drug was stable under these conditions for the duration of the study. <sup>(299)</sup>

**Sorption** — Floxacillin sodium was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(536)</sup> <sup>(606)</sup>

## Floxuridine - AHFS 10:00

**Products** — Floxuridine is supplied in 5-mL vials containing 500 mg of drug. Reconstitute with 5 mL of sterile water for injection to yield a 100-mg/mL concentration. <sup>(1-1/04)</sup> (4)

*pH* — From 4 to 5.5. <sup>(1-1/04)</sup> (4)

**Administration** — Floxuridine is administered by continuous arterial infusion using an infusion device after dilution in dextrose 5% or sodium chloride 0.9%. <sup>(1-1/04)</sup> (4) Floxuridine has also been administered investigationally by intravenous injection or infusion. <sup>(4)</sup>

**Stability** — The reconstituted solution should be stored under refrigeration at 2 to 8 °C and used within two weeks. <sup>(1-1/04)</sup> (4)

The pH of optimum stability is 4 to 7. Extreme acidity or alkalinity may result in hydrolysis. <sup>(1379)</sup>

At a concentration of 5 mg/mL in sodium chloride 0.9%, floxuridine supported the growth of several microorganisms commonly implicated in nosocomial infections, including *Escherichia coli*, *Pseudomonas aeruginosa*, and *Candida albicans*. The arbitrary application of an extended expiration date to floxuridine solutions is, therefore, highly questionable. <sup>(827)</sup>

**Syringes** — Floxuridine (Roche) 50 mg/mL and 1 mg/mL in sodium chloride 0.9% was packaged as 3 mL in 10-mL polypropylene infusion pump syringes (Pharmacia Deltec). Little or no loss occurred during 21 days of storage at 30 °C. <sup>(1967)</sup>

**Implantable Pumps** — Floxuridine 10 mg/mL was filled into an implantable infusion pump (Fresenius VIP 30) and associated capillary tubing and stored at 37 °C. No floxuridine loss and no contamination from components of pump materials occurred during six weeks of storage. However, an unidentified substance appeared in pump seven weeks, and 22% loss of floxuridine occurred by eight weeks. <sup>(1903)</sup>

Floxuridine (Roche), at concentrations ranging from about 2.5 to 12 mg/mL with heparin sodium 200 units/mL in bacteriostatic sodium chloride 0.9%, was evaluated for stability in an implantable infusion pump (Infusaid model 400). In this in vivo assessment, the floxuridine concentrations were determined prior to implantation in patients and again at the time of pump refills. No appreciable floxuridine loss occurred during eight courses of therapy, from 4 to 12 days in duration, in five patients. <sup>(767)</sup>

### Compatibility Information

#### Solution Compatibility

## Fluconazole - AHFS 8:14.08

**Products** — Fluconazole is available for intravenous infusion in 100- and 200-mL glass bottles and PVC bags in sodium chloride or dextrose diluents. Each milliliter of solution contains fluconazole 2 mg and either sodium chloride 9 mg or dextrose 56 mg. <sup>(1-6/06)</sup>

*pH* — From 4 to 8 in the sodium chloride diluent and from 3.5 to 6.5 in the dextrose diluent. <sup>(1-6/06)</sup>

*Osmolarity* — The infusion solution is iso-osmotic <sup>(1-6/06)</sup>, having an osmolarity of 300 to 315 mOsm/L. <sup>(4)</sup>

*Trade Name(s)* — Diflucan

**Administration** — Fluconazole is administered by intravenous infusion at a rate not exceeding 200 mg/hr. <sup>(1-6/06)</sup> (4)

**Stability** — Fluconazole injection in glass bottles or PVC bags should be stored between 5 and 30 °C or between 5 and 25 °C, respectively, and protected from freezing. Brief exposure to temperatures up to 40 °C does not adversely affect the product in PVC bags. The overwrap moisture barrier should not be removed from the PVC bags until ready for use. The solution should not be used if it is cloudy or precipitated. <sup>(1-6/06)</sup> (4)

*Elastomeric Reservoir Pumps* — Fluconazole (Pfizer) 2 mg/mL in sodium chloride 0.9% was evaluated for binding to natural rubber elastomeric reservoirs (Baxter). Less than 2% binding was found after storage for two weeks at 35 °C with gentle agitation. <sup>(2014)</sup>

*Central Venous Catheter* — Fluconazole (Roerig) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

#### Solution Compatibility

##### Fluconazole

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	BA <sup>a</sup>	PF	1 g	Stable for 24 hr at 25 °C in fluorescent light	1676	C
Ringer's injection, lactated	BA <sup>a</sup>	PF	1 g	Stable for 24 hr at 25 °C in fluorescent light	1676	C

<sup>a</sup>Tested in PVC containers.

#### Additive Compatibility

##### Fluconazole

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Acyclovir sodium	BW	5 g	PF	1 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Acyclovir not tested	1677	C

Amikacin sulfate	BR	2.5 g	PF	1 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Amikacin not tested	<a href="#">1677</a>	C
Amphotericin B	LY	50 mg	PF	1 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C. Amphotericin B not tested	<a href="#">1677</a>	C
Cefazolin sodium	SM	10 g	PF	1 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Cefazolin not tested	<a href="#">1677</a>	C
Ceftazidime	GL	20 g	PF	1 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Ceftazidime not tested	<a href="#">1677</a>	C
Ciprofloxacin	BAY	1 g	RR	1 g		Visually compatible with no loss of ciprofloxacin in 24 hr at 22 °C under fluorescent light. Fluconazole not tested	<a href="#">2413</a>	C
Clindamycin phosphate	AST	6 g	PF	1 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Clindamycin not tested	<a href="#">1677</a>	C
Gentamicin sulfate	SO	0.5 g	PF	1 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Gentamicin not tested	<a href="#">1677</a>	C
Heparin sodium	BA	50,000 units	PF	1 g	D5W <sup>a</sup>	Fluconazole stable for 24 hr at 25 °C in fluorescent light. Heparin not tested	<a href="#">1676</a>	C
Meropenem	ZEN	1 and 20 g	RR	2 g	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C
Metronidazole	AB	2.5 g	PF	1 g		Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Metronidazole not tested	<a href="#">1677</a>	C
Morphine sulfate	ES	0.25 g	PF	1 g	D5W <sup>a</sup>	Fluconazole stable for 24 hr at 25 °C in fluorescent light. Morphine not tested	<a href="#">1676</a>	C
Ondansetron HCl with ranitidine HCl	GL GL	100 mg 500 mg	RR	2 g	<sup>a</sup>	Visually compatible with no loss of any drug in 4 hr	<a href="#">1730</a>	C
Potassium chloride	AB	10 mEq	PF	1 g	D5W <sup>a</sup>	Fluconazole stable for 24 hr at 25 °C in fluorescent light	<a href="#">1676</a>	C

Ranitidine HCl with ondansetron HCl	GL GL	500 mg 100 mg	RR	2 g	<sup>a</sup>	Visually compatible with no loss of any drug in 4 hr	<a href="#">1730</a>	C
Theophylline	BA	0.4 g	PF	1 g	D5W <sup>a</sup>	Fluconazole stable for 72 hr at 25 °C in fluorescent light. Theophylline not tested	<a href="#">1676</a>	C
Trimethoprim-sulfamethoxazole	ES	0.4 <sup>b</sup> g	PF	1 g	D5W	Delayed cloudiness and precipitation. No fluconazole loss in 72 hr at 25 °C under fluorescent light	<a href="#">1677</a>	I

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

### Drugs in Syringe Compatibility

#### Fluconazole

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Pantoprazole sodium	<sup>a</sup>	4 mg/1 mL		2 mg/1 mL	Possible precipitate within 4 hr	<a href="#">2574</a>	I

<sup>a</sup>Test performed using the formulation WITHOUT edetate disodium.

### Y-Site Injection Compatibility (1:1 Mixture)

#### Fluconazole

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Final concentration after mixing.

<sup>d</sup>Tested in dextrose 5%, Ringer's injection, lactated, sodium chloride 0.45%, and sodium chloride 0.9%.

<sup>e</sup>Tested in dextrose 5% with albumin human 2 mg/mL.

<sup>f</sup>Lyophilized formulation tested.

<sup>g</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup>Varying volumes to simulate varying administration rates.

<sup>i</sup>Final concentrations were 1.5 mg/mL of fluconazole and 5 and 20 mcg/mL of tacrolimus.

<sup>j</sup>Tested in Ringer's injection, lactated.

<sup>k</sup>Tested in sterile water for injection.

<sup>l</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>m</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>n</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>o</sup>Quinupristin and dalfopristin components combined.

<sup>p</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

## Fludarabine Phosphate - AHFS 10:00

**Products** — Fludarabine phosphate is supplied as a lyophilized product in 6-mL vials containing 50 mg of drug with mannitol 50 mg and sodium hydroxide for pH adjustment. Reconstitute with 2 mL of sterile water for injection to yield a 25-mg/mL concentration. <sup>(1-9/06)</sup>

Fludarabine phosphate is also available as a 50-mg/2 mL solution with disodium phosphate dihydrate and sodium hydroxide for pH adjustment. <sup>(1-9/06)</sup>

*pH* — From pH 7.2 to 8.2 for the reconstituted powder. From pH 7.3 to 7.7 for the liquid. <sup>(1-9/06)</sup>

*Trade Name(s)* — Fludara

**Administration** — Fludarabine phosphate is administered by intravenous infusion over 30 minutes in 100 or 125 mL of dextrose 5% or sodium chloride 0.9%. <sup>(1-9/06)</sup> (4) The drug also has been administered by rapid intravenous injection and continuous infusion, although the risk of toxicity may be increased. <sup>(4)</sup>

**Stability** — Intact vials should be stored under refrigeration. The manufacturer recommends use of the reconstituted solution within eight hours because it does not contain an antibacterial preservative. <sup>(1-9/06)</sup> Nevertheless, the drug is chemically stable in solution, exhibiting less than 2% decomposition in 16 days when stored at room temperature and exposed to normal laboratory light. <sup>(234)</sup>

Fludarabine phosphate (Berlex) 0.2 mg/mL diluted in sodium chloride 0.9% and stored at 22 °C did not exhibit an antimicrobial effect on the growth of *Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans* inoculated into the solution. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration dates. <sup>(2160)</sup>

*pH Effects* — Fludarabine phosphate is stable in aqueous solution at pH 4.5 to 8. The pH of optimum stability is approximately 7.6. <sup>(234)</sup>

*Sorption* — Fludarabine phosphate 0.04 mg/mL in dextrose 5% or sodium chloride 0.9% was equally stable in either glass or PVC containers, exhibiting no loss due to sorption during 48 hours at room temperature or under refrigeration. <sup>(234)</sup>

### Compatibility Information

#### Solution Compatibility

##### Fludarabine phosphate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%			1 g	Under 3% loss in 16 days at room temperature in light	234	C
Dextrose 5%			40 mg	No loss in 48 hr at room temperature or refrigerated	234	C
Sodium chloride 0.9%			1 g	Under 3% loss in 16 days at room temperature in light	234	C

#### Y-Site Injection Compatibility (1:1 Mixture)

Fludarabine Phosphate - AHFS 10:00

## Flumazenil - AHFS 28:92

**Products** — Flumazenil is available as a 0.1-mg/mL solution in 5- and 10-mL multiple-dose vials. In addition to flumazenil, each milliliter also contains methylparaben 1.8 mg, propylparaben 0.2 mg, sodium chloride 0.9%, edetate disodium 0.01%, and acetic acid 0.01%. The pH is adjusted with hydrochloric acid and, if necessary, sodium hydroxide. [\(1-12/07\)](#)

*pH* — The injection has a pH of approximately 4. [\(1-12/07\)](#)

*Trade Name(s)* — Romazicon

**Administration** — Flumazenil is administered intravenously over 15 to 30 seconds. To minimize pain at the injection site, flumazenil should be administered through a freely running intravenous infusion line into a large vein. Extravasation should be avoided. [\(1-12/07\)](#) (4)

**Stability** — Flumazenil injection is a stable aqueous solution; it should be stored at controlled room temperature. Discard the product 24 hours after removal from its original vial, whether admixed in an infusion solution or simply drawn into a syringe. [\(1-12/07\)](#)

Flumazenil - AHFS 28:92

## Fluorouracil (5-FLUOROURACIL) - AHFS 10:00

**Products** — Fluorouracil injection is available in 10- and 20-mL single-use vials and in 50- and 100-mL bulk pharmacy vials for preparation of individual doses.<sup>(4)</sup> Each milliliter contains fluorouracil 50 mg with sodium hydroxide and/or hydrochloric acid for pH adjustment.<sup>(1-1/08)</sup>

*pH* — The pH is adjusted to approximately 9.2 with a range of 8.6 to 9.4.<sup>(1-1/08)</sup> (4)

**Administration** — Fluorouracil is administered intravenously. Care should be taken to avoid extravasation. Dilution of the injection is not required for administration.<sup>(1-1/08)</sup> (4) Fluorouracil has also been given by portal vein or hepatic artery infusion.<sup>(4)</sup>

In the event of spills or leaks, the use of sodium hypochlorite 5% (household bleach) to inactivate fluorouracil is recommended.<sup>(1200)</sup>

**Stability** — Fluorouracil is normally colorless to faint yellow. Its stability and safety are not affected by slight discoloration during storage. It should be stored at controlled room temperature and protected from light<sup>(1-1/08)</sup> (4) and freezing<sup>(4)</sup>. Storing the vials in the original cartons until the time of use is recommended.<sup>(1-1/08)</sup> The color of the solution results from the presence of free fluorine. A dark yellow indicates greater decomposition. Such decomposition may result from storage for several months at temperatures above room temperature. It is suggested that solutions having a darker yellow color be discarded.<sup>(398)</sup> Exposure to sunlight or intense incandescent light has also caused degradation. The solutions changed to dark amber to brown.<sup>(760)</sup> A precipitate may form from exposure to low temperatures and may be resolubilized by heating to 60 °C with vigorous shaking.<sup>(1-1/08)</sup> (4) (Note: Allow the solution to cool to body temperature before administration.)

Microwave radiation also has been used to resolubilize the precipitate. Ampuls of fluorouracil containing a precipitate were exposed to microwave radiation and shaken until clear. These ampuls were then compared to ampuls that were heated to 60 °C and shaken until clear and also to unheated controls. The precipitate was redissolved by microwave radiation without significantly affecting the drug. No significant decrease in concentration was observed. There was a slight change in pH. The authors concluded that microwave radiation was a suitable method for solubilizing the precipitate that may form in fluorouracil ampuls. However, they warned that extreme care should be taken to avoid overheating and the resulting explosions from excessive pressure in the ampuls.<sup>(662)</sup>

Fluorouracil (Roche) 1 mg/mL in dextrose 5% was evaluated for stability in translucent containers (Perfupack Y, Baxter) and five opaque containers [green PVC Opafuseur (Bruneau), white EVA Perfupaque (Baxter), orange PVC PF170 (Cair), white PVC V86 (Codan), and white EVA Perfecran (Fandre)] when exposed to sunlight for 28 days. No photodegradation or sorption was found. However, an increase in concentration due to moisture permeation was detected after two weeks.<sup>(1750)</sup>

Immersion of a needle with an aluminum component in fluorouracil (Adria) 50 mg/mL resulted in no visually apparent reaction after seven days at 24 °C.<sup>(988)</sup>

Fluorouracil (Adria) 500 mg/10 mL did not support the growth of several microorganisms commonly implicated in nosocomial infections. The bacteriostatic properties were observed against *Escherichia coli*, *Klebsiella pneumoniae*, *Staphylococcus epidermidis*, *Pseudomonas aeruginosa*, *Candida albicans*, and *Clostridium perfringens*.<sup>(828)</sup>

In another study, fluorouracil (Adria) 1 g/20 mL transferred to PVC containers did not support the growth of several microorganisms and may have imparted an antimicrobial effect at this concentration. Loss of viability was observed for *Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Pseudomonas cepacia*, *Candida albicans*, and *Aspergillus niger*.<sup>(1187)</sup>

Fluorouracil eliminated the viability of *Staphylococcus epidermidis* ( $10^6$  to  $10^7$  CFU/mL) in varying time periods, depending on concentration and diluent, when stored at near-body temperature (35 °C). At 50 mg/mL, no viability was found after five days of incubation. At 10 mg/mL in sodium chloride 0.9% and dextrose 5%, no viability was found after seven and five days, respectively. Following dilution to 10 mg/mL with bacteriostatic sodium chloride 0.9%, no viability was found after two days. [\(1659\)](#)

*pH Effects* — At a pH greater than 11, slow hydrolysis of fluorouracil occurs. At a pH less than 8, solubility is reduced and precipitation may or may not occur, depending on the concentration. [\(1369\)](#) [\(1379\)](#)

Fluorouracil 50 mg/mL (Lyphomed, Roche, and SoloPak) exhibited precipitation in two to four hours at pH 8.6 to 8.68; precipitation occurred immediately at pH 8.52 or less. The precipitate consisted of needle-shaped crystals at pH 8.26 to 8.68. Cluster-shaped crystals formed at pH 8.18 and below. [\(1489\)](#)

Admixture with acidic drugs or drugs that decompose in an alkaline environment should be avoided. [\(524\)](#)

A color change to deep purple was reported for the mixtures of doxorubicin hydrochloride (Adria) 10 mg/L with fluorouracil (Roche) 250 mg/L in dextrose 5%. [\(296\)](#) This color change is indicative of decomposition occurring in solutions with an alkaline pH. It also occurs with other anthracyclines. [\(394\)](#)

*Freezing Solutions* — Fluorouracil (Abic) 5 mg/0.5 mL in sodium chloride 0.9% in polypropylene syringes (Plastipak, Becton Dickinson) was stored frozen at -20 °C. No fluorouracil loss occurred in eight weeks. Refreezing and further storage at -20 °C for another two weeks also did not result in a fluorouracil loss. [\(1666\)](#)

Fluorouracil (Teva) near 6.8 mg/mL in sodium chloride 0.9% in PVC bags was stored frozen at -20 °C for 79 days, thawed in a microwave oven, and stored for an additional 28 days under refrigeration. No precipitation or crystallization occurred. No fluorouracil loss occurred after frozen storage and about 6% loss occurred after the subsequent refrigerated storage. [\(2807\)](#)

*Syringes* — Fluorouracil 25 mg/mL in polypropylene syringes (Braun Omnifix) was stable for 28 days at 4 and 20 °C. [\(1564\)](#)

Fluorouracil (Roche) 50 mg/mL was packaged as 3 mL in 10-mL polypropylene infusion pump syringes (Pharmacia Deltec). Little or no loss occurred during 21 days of storage at 30 °C. [\(1967\)](#)

Fluorouracil (Roche) 12 and 40 mg/mL diluted with sodium chloride 0.9% and dextrose 5% was packaged in 60-mL polypropylene syringes and stored at 25 °C protected from light. Losses of 5% or less occurred in the solutions after storage for 72 hours. Furthermore, the solutions had no visually apparent precipitate or discoloration. [\(1983\)](#)

*Ambulatory Pumps* — The stability of undiluted fluorouracil 50 mg/mL from three manufacturers (Lyphomed, Roche, and SoloPak) in the reservoirs of four portable infusion pumps (Pharmacia Deltec CADD-1, Model 5100; Cormed II, Model 10500; Medfusion Infumed 200; and Pancretec Provider I.V., Model 2000) was evaluated. The fluorouracil was delivered by the pumps at a rate of 10 mL/day over a seven-day cycle at 25 and 37 °C. All fluorouracil samples in all pump reservoirs were stable over the seven-day study period, exhibiting little or no drug loss and only minimal leached plasticizer (DEHP) at either temperature. [\(1489\)](#)

However, precipitation of the Roche fluorouracil was observed with all pumps; a fine white precipitate originated close to the connection junction and migrated in both directions until it occupied most of the tubing and was in the drug reservoir. In some cases, the pumps stopped due to

the extent of precipitation. The authors noted that various factors, including solution pH, temperature, drug concentration and solubility, and the manipulative techniques used could contribute to precipitate formation. <sup>(1489)</sup>

Undiluted fluorouracil (Roche) 50 mg/mL in ethylene vinyl acetate (EVA) bags for use with portable infusion pumps remained stable, with little or no loss after 28 days at 4, 22, and 35 °C. The containers at 35 °C did sustain approximately a 3% water loss due to evaporation during storage, increasing the fluorouracil concentration slightly. <sup>(1548)</sup>

Fluorouracil (David Bull Laboratories) 25 mg/mL was stable in PVC reservoirs (Parker Micropump) for 14 days at 4 and 37 °C, exhibiting no loss. <sup>(1696)</sup>

The stability of undiluted fluorouracil injection (Roche) 50 mg/mL in EVA reservoirs (Celsa) and PVC reservoirs (Pharmacia) for use with ambulatory infusion pumps was evaluated. The filled reservoirs were stored for 14 days at 4 °C and at 33 °C to simulate the conditions of prolonged infusion from the reservoirs kept under patients' clothing. No loss of fluorouracil due to decomposition was found. However, the refrigerated samples exhibited substantial (up to 15%) loss of drug content from solution due to gross precipitation. Flocculent precipitation was observed in as little as three days. (Subvisible precipitation may occur earlier.) At the elevated temperature, substantial increases in concentration of fluorouracil occurred in the EVA reservoirs due to water loss from permeation through the plastic reservoir. Approximately 5% increase in drug concentration occurred in 14 days. No change in concentration occurred in the PVC reservoirs during this time frame. <sup>(2004)</sup>

*Implantable Pumps* — Fluorouracil 50 mg/mL was filled into an implantable infusion pump (Fresenius VIP 30) and associated capillary tubing and stored at 37 °C. No fluorouracil loss and no contamination from components of pump materials occurred during eight weeks of storage. <sup>(1903)</sup>

Fluorouracil combined with leucovorin calcium for repeated administration using a Fresenius implanted port resulted in blockage of the pump catheter and necessitated surgical removal of the port. The blockage was caused by precipitation of calcium carbonate in the catheter. <sup>(2504)</sup>

*Sorption* — Fluorouracil was shown not to exhibit sorption to PVC bags and tubing, polyethylene bags or tubing, Silastic tubing, and polypropylene and polyethylene syringes. <sup>(536) (606) (760) (2420) (2430)</sup>

Fluorouracil may be more extensively adsorbed to glass surfaces than to plastic. In one report, significant loss occurred from solutions in glass vials, but almost quantitative recovery was obtained from polyethylene and polypropylene plastic vials. The loss was ascribed to adsorption to the glass surface. <sup>(663)</sup> This difference was also observed in dextrose 5% in glass and PVC infusion containers. A 10% loss of fluorouracil occurred in 43 hours in the PVC containers but in only seven hours in the glass containers. <sup>(519)</sup>

*Filtration* — Fluorouracil 10 to 75 mcg/mL exhibited little or no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters. <sup>(1415) (1416)</sup>

*Central Venous Catheter* — Fluorouracil (Roche) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## **Compatibility Information**

Fluorouracil (5-FLUOROURACIL) - AHFS 10:00

## Fluphenazine Hydrochloride - AHFS 28:16.08.24

**Products** — Fluphenazine hydrochloride is available in 10-mL multiple-dose vials. Each milliliter contains fluphenazine hydrochloride 2.5 mg with sodium chloride for isotonicity, sodium hydroxide or hydrochloric acid to adjust the pH, and methylparaben 0.1% and propylparaben 0.01% as preservatives. [\(1-9/08\)](#)

*pH* — From 4.8 to 5.2. [\(1-9/08\)](#) (4)

**Administration** — Fluphenazine hydrochloride is administered by intramuscular injection. [\(1-9/08\)](#) (4)

**Stability** — Intact vials should be stored at controlled room temperature and protected from freezing and light. Parenteral solutions of fluphenazine hydrochloride vary from colorless to light amber. Solutions that are darker than light amber, are discolored in some other way, or contain a precipitate should not be used. [\(1-9/08\)](#) (4)

## Folic Acid - AHFS 88:08

**Products** — Folic acid 5 mg/mL injection is available in 10-mL vials. Each milliliter of solution also contains edetate sodium 5 mg, benzyl alcohol 2 mg, and hydrochloric acid and/or sodium hydroxide to adjust pH in water for injection. <sup>(1-1/08)</sup>

*pH* — From 8 to 11. <sup>(1-1/08)</sup> (4)

**Administration** — Folic acid injection is administered by deep intramuscular, intravenous, or subcutaneous injection. <sup>(1-1/08)</sup> (4)

**Stability** — Intact vials should be stored at controlled room temperature and protected from light. <sup>(1-1/08)</sup> The yellow to orange-yellow solutions are heat sensitive and should be protected from light <sup>(4)</sup> for long-term storage. However, exposure of folic acid in parenteral nutrition solutions to fluorescent light for 48 hours did not cause any significant loss of folic acid. <sup>(896)</sup>

*pH Effects* — Folic acid is soluble in solutions of pH 5.6 or above at room temperature to a concentration of 1 g/L. However, below about pH 4.5 to 5, folic acid may precipitate in varying time periods, depending on the acidity of the solution. In the small concentrations used for parenteral nutrition, a pH of above 5 ensures that folic acid will remain in solution. Most parenteral nutrition solutions are buffered by the amino acids to pH 5 to 6. <sup>(895)</sup>

The rate of folic acid photodegradation is higher in an acidic medium compared to the rate in an alkaline medium. <sup>(2496)</sup>

*Sorption* — A parenteral nutrition solution containing 13 mcg/L of folic acid injection in a 3-L PVC bag and run through an administration set delivered the full amount of folic acid, with no loss. <sup>(895)</sup>

*Filtration* — Folic acid (Lederle) 0.5 mg/L in dextrose 5% and sodium chloride 0.9% was filtered at 120 mL/hr for six hours through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2). No significant reduction due to binding to the filter was noted. <sup>(533)</sup>

### Additional Compatibility Information

*Parenteral Nutrition Solutions* — A 40% drop in folic acid concentration occurred immediately after admixture in a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, trace elements, and multivitamins in PVC bags. The folic acid concentration then remained relatively constant for 28 days when stored at both 4 and 25 °C. [\(1063\)](#)

Extensive decomposition of ascorbic acid and folic acid was reported in a parenteral nutrition solution composed of amino acids 3.3%, dextrose 12.5%, electrolytes, trace elements, and M.V.I.-12 (USV) in PVC bags. Half-lives were 1.1, 2.9, and 8.9 hours for ascorbic acid and 2.7, 5.4, and 24 hours for folic acid stored at 24 °C in daylight, 24 °C protected from light, and 4 °C protected from light, respectively. The decomposition was much greater than for solutions not containing catalyzing metal ions. Also, it was greater than for the vitamins singly because of interactions with the other vitamins present. [\(1059\)](#)

Because of these interactions, recommendations to separate the administration of vitamins and trace elements have been made. [\(1056\)](#) [\(1060\)](#) [\(1061\)](#) Other researchers have termed such recommendations premature based on differing reports [\(895\)](#) [\(896\)](#) and the apparent absence of epidemic vitamin deficiency in parenteral nutrition patients. [\(1062\)](#)

The stability of several vitamins from M.V.I.-12 (Armour) admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, in glass bottles and PVC bags at 25 and 5 °C for 48 hours was reported. Folic acid was stable in all samples. [\(1431\)](#)

In another study, the stability of several vitamins (from M.V.I.-12) following admixture with four different amino acid products (FreAmine III, Neopham, Novamine, Travasol) with or without Intralipid when stored in glass bottles or PVC bags at 25 °C for 48 hours was reported.

High-intensity phototherapy light did not affect folic acid. When bisulfite was added to the Neopham admixture, folic acid was unaffected. The authors concluded that intravenous multivitamins should be added to parenteral nutrition admixtures immediately prior to administration to reduce losses of vitamins other than folic acid since commercially available amino acid products may contain bisulfites and have varying pH values.<sup>(487)</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the other vitamins, including folic acid, retained their initial concentrations.<sup>(2796)</sup>

Folic Acid - AHFS 88:08

## Foscarnet Sodium - AHFS 8:18.92

**Products** — Foscarnet sodium is available as a 24-mg/mL infusion solution in water for injection in 250- and 500-mL glass bottles. Hydrochloric acid and/or sodium hydroxide may have been added to adjust the pH. [\(1-11/06\)](#)

*pH* — Adjusted to pH 7.4. [\(1-11/06\)](#)

*Trade Name(s)* — Foscavir

**Administration** — Foscarnet sodium is administered by intravenous infusion, using an infusion pump. It should not be given by rapid injection. Recommended rates of infusion are a minimum of one hour for doses of 60 mg/kg and up to two hours for doses of 120 mg/kg. Recommended dosage, frequency, and administration rates should not be exceeded. For peripheral administration, foscarnet sodium solution must be diluted to 12 mg/mL with dextrose 5% or sodium chloride 0.9%. The drug may be infused without dilution through a central catheter. [\(1-11/06\)](#) (4)

**Stability** — Foscarnet sodium injection is a clear, colorless solution. It should be stored at controlled room temperature and protected from temperatures above 40 °C and from freezing. The product should be used only if the seal is intact and a vacuum is present. [\(1-11/06\)](#)

The manufacturer has stated that foscarnet sodium diluted in dextrose 5% or sodium chloride 0.9% and transferred to PVC containers is stable for 24 hours at room temperature or under refrigeration. [\(71\)](#)

Foscarnet sodium may chelate divalent metal ions and is chemically incompatible with solutions containing calcium such as Ringer's injection, lactated, and parenteral nutrition solutions. [\(1-11/06\)](#)

Foscarnet sodium (Astra) 13 mg/mL diluted in sodium chloride 0.9% at 22 °C did not exhibit an antibacterial effect on the growth of three organisms (*Enterococcus faecium*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*) inoculated into the solution. Foscarnet sodium did exhibit moderate antifungal activity against *Candida albicans*. The authors recommended that ready-to-use solutions be stored under refrigeration whenever possible and that the potential for microbiological growth should be considered when assigning expiration periods. [\(2160\)](#)

**Autoclaving** — The concentration of foscarnet sodium (Astra), diluted in sodium chloride 0.9% to 12 mg/mL and packaged in glass infusion bottles with rubber bungs, was compared before and after autoclaving at 30 psi for 15 minutes at 121 °C. The foscarnet sodium concentration did not change after autoclaving. Therefore, the dilution may be autoclaved to avoid limiting its shelf life due to sterility concerns. [\(1835\)](#)

**Elastomeric Reservoir Pumps** — Foscarnet sodium (Astra) 24 mg/mL was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for two weeks at 35 °C with gentle agitation. [\(2014\)](#)

## Fosphenytoin Sodium - AHFS 28:12.12

**Products** — Fosphenytoin is the prodrug for its metabolite, phenytoin. Fosphenytoin sodium is available in 2- and 10-mL vials as a 75-mg/mL solution, which is the equivalent of phenytoin sodium 50 mg/mL after administration. Each milliliter also contains tromethamine (TRIS) buffer along with hydrochloric acid or sodium hydroxide to adjust pH in water for injection.<sup>(1)</sup> CAUTION: Care should be taken to avoid confusion between the two different forms (fosphenytoin sodium and phenytoin sodium) to prevent dosing errors.

**Units** — Each 75 mg of fosphenytoin sodium is metabolically converted to 50 mg of phenytoin after administration. NOTE: The amount and concentration of fosphenytoin sodium are expressed in terms of the equivalent mass of phenytoin sodium, called phenytoin sodium equivalents (PE). The manufacturer indicates that this avoids the need to perform conversions based on molecular weight between the two forms.<sup>(1)</sup> However, it creates the need to express all prescribing, dispensing, and dosing consistently in PE to avoid dosing errors that could result from confusion between the two forms.

**pH** — From 8.6 to 9.0.<sup>(1)</sup>

**Trade Name(s)** — Cerebyx

**Administration** — Fosphenytoin sodium is dosed in terms of phenytoin sodium equivalents (PE). CAUTION: Care should be taken to ensure that all prescribing, preparation, and dosing is performed using the correct units and that any confusion between the two forms (fosphenytoin sodium and phenytoin sodium) is avoided.

Fosphenytoin sodium is administered intravenously at a rate no greater than 150 mg PE/min. The drug may be diluted in dextrose 5% or sodium chloride 0.9% to a concentration of 1.5 to 25 mg PE/mL. It has also been given intramuscularly.<sup>(1)</sup>

**Stability** — Fosphenytoin sodium injection is a clear, colorless to pale yellow solution. Intact vials should be stored under refrigeration at 2 to 8 °C. Storage at controlled room temperature should not exceed 48 hours. Any vials that develop particulate matter should not be used.<sup>(1)</sup>

**Freezing Solutions** — Fosphenytoin sodium (Parke-Davis) 1, 8, and 20 mg PE (phenytoin sodium equivalents) per milliliter in dextrose 5% (Baxter) and sodium chloride 0.9% (Baxter) in PVC containers and undiluted fosphenytoin sodium 50 mg PE per milliliter were packaged in 3-mL polypropylene syringes sealed with tip caps (Becton Dickinson). The samples were frozen at -20 °C. Little or no loss occurred after 30 days of frozen storage followed by seven days at 4 or 25 °C. Stability was also maintained if the thawed samples that had been stored at 25 °C were returned to the freezer for an additional seven days.<sup>(2083)</sup>

**Syringes** — Fosphenytoin sodium (Parke-Davis) 50 mg PE (phenytoin sodium equivalents) per milliliter was packaged in 3-mL polypropylene syringes with syringe caps (Becton Dickinson) and stored at -20, 4, and 25 °C. The samples stored at 4 and 25 °C exhibited little or no loss of fosphenytoin sodium in 30 days. The samples stored at -20 °C also showed little or no loss of fosphenytoin sodium after 30 days' storage followed by seven days at 4 °C or at 25 °C. Also, stability was maintained if the thawed samples that had been stored at 25 °C were returned to the freezer for an additional seven days.<sup>(2083)</sup>

### Compatibility Information

#### Solution Compatibility

#### Fosphenytoin sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
----------	-----	-----	--------	---------	-----	-----

Dextrose 5% in Ringer's injection, lactated	BA <sup>a</sup>	PD	1, 8, 20 mg PE/mL	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Dextrose 5% in sodium chloride 0.45%	BA <sup>a</sup>	PD	1, 8, 20 mg PE/mL	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Dextrose 5%	BA <sup>ab</sup>	PD	1, 8, 20 mg PE/mL	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Dextrose 10%	BA <sup>a</sup>	PD	1, 8, 20 mg PE/mL	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Plasma-Lyte A, pH 7.4	BA <sup>a</sup>	PD	1, 8, 20 mg PE/mL	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Ringer's injection, lactated	BA <sup>a</sup>	PD	1, 8, 20 mg PE/mL	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Sodium chloride 0.9%	BA <sup>ab</sup>	PD	1, 8, 20 mg PE/mL	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in glass containers.

### Additive Compatibility

#### Fosphenytoin sodium

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Hetastarch in sodium chloride 0.9%	MG	6%	PD	1, 8, 20 mg PE/mL	NS	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Mannitol	BA <sup>a</sup>	20%	PD	2, 8, 20 mg PE/mL		Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C
Potassium chloride	BA	20 and 40 mEq	PD	1, 8, 20 mg PE/mL	D5(1/2)S <sup>a</sup>	Visually compatible with little or no loss in 7 days at 25 °C under fluorescent light	<a href="#">2083</a>	C

<sup>a</sup>Tested in PVC containers.

### Y-Site Injection Compatibility (1:1 Mixture)

#### Fosphenytoin sodium

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Fenoldopam mesylate	AB	80 mcg/mL <sup>a</sup>	PD	20 mg PE/mL <sup>a</sup>	Trace haze and microparticulates form in 4 hr	<a href="#">2467</a>	I

## Dedications

*To those pharmacists who understand that research  
is part of the mission of pharmacy,  
To Cyndi, for keeping the faith, never giving up, and reaching for her dream,  
and, as always,  
To Pam, for her love, forbearance, and continuing support*

## Acknowledgments

I would gratefully like to acknowledge the valuable contributions of the following individuals, who helped in the preparation and review of the seventeenth edition of the *Handbook on Injectable Drugs*:

WILLIAM J. DANA, Pharm.D., FASHP, Quality Assurance Pharmacist, Harris County Hospital District, Houston, Texas

N. PAULINE THOMAS PARKS, M.S., Consultant Pharmacist, Houston, Texas

WENDY D. SMITH, Pharm.D., BCPS, Clinical Pharmacy Specialist in Drug Information and Drug Use Policy, Division of Pharmacy, The University of Texas, M. D. Anderson Cancer Center, Houston, Texas

## Preface

The *Handbook on Injectable Drugs*, 17th edition, is the most recent contribution in this continuing series. With its publication, all previous editions are considered out of date.

For proper use of this reference work, the reader must review the *How to Use the Handbook* section that immediately follows this preface. This section will acquaint the user of the *Handbook* with its organization, content, structure, summarization strategy, interpretation of the information presented, and limitations of the published literature on which the *Handbook* is based. Without a good working knowledge of these points, the *Handbook* may not be used to its best advantage or even interpreted correctly.

The 17th edition of the *Handbook on Injectable Drugs* brings together information on 332 parenteral drugs commercially available in the United States and in other countries. The information in the 17th edition is accumulated from 2830 references, including 42 new to this edition. As for each previous edition, the monographs have been completely updated. In addition to the updated monographs, two additional monographs on ceftaroline fosamil and telavancin hydrochloride are new to this edition. Also, some monograph reorganization and redundancy pruning has been performed to aid in use of the information, especially in electronic form.

*Note of Appreciation* — I want to thank a number of individuals who have helped in the creation of the many editions of the *Handbook on Injectable Drugs* over 35 years. Karen Hale, Dan Haas, Mary Baker, Todd Canada, William Dana, N. Pauline Thomas Parks, Wendy Smith, and Quanyun Xu contributed their time and talents to aid me in preparing difficult manuscripts. Their input has helped to make the *Handbook* a better resource for many editions. In addition, Shelly Elliott initially, then Johnna Hershey undertook and conducted the process that makes a book from a difficult manuscript and did so in exemplary form throughout these decades. Thanks to all for your help.

I also want to thank Dr. Roger Anderson who as head of the pharmacy at M. D. Anderson Cancer Center had the vision, foresight, and wisdom to establish the clinical pharmaceuticals laboratory that for over 15 years conducted so much of the research, literally hundreds of studies, which contributed so much to our profession's knowledge of the clinical pharmaceuticals of parenteral drugs. Unfortunately, those days were ended much too soon because new pharmacy management abruptly stopped our research. Although I am very pleased with what we were able to accomplish, I wish we would have had additional time so that we could have done more.

The individuals who worked so diligently on the numerous drug stability and compatibility research projects that we conducted in our clinical pharmaceuticals laboratory in the pharmacy at the University of Texas, M. D. Anderson Cancer Center over those 15 years also deserve special recognition. The hundreds of studies that the following individuals helped to perform created many thousands of research results that are a substantial part of the world's knowledge base on the stabilities and compatibilities of parenteral drugs. Without the outstanding efforts of the individuals acknowledged below, the pharmacy profession in the United States and around the world would have much less of this information that is so valuable in patient care. Thanks to all of you. Doward Gilbert, Pharm.D.

Delshalonda Ingram, Pharm.D.

Juan Martinez  
Abayomi Ogundele, Pharm.D.  
Christopher Saenz, Pharm.D.  
Kimberly Williams, Pharm.D.  
Quanyun Xu, Ph.D.  
Yan-Ping Zhang, B.S. Pharm.

And of course my wife, Pam, and daughter, Cyndi, have had to endure the enormous time commitment that the *Handbook* represents 17 times over 35 years, not to mention all of the other manuscripts, books, and databases that have consumed my professional life. I recognize that I have spent much of our lives together with papers, proofs, and publishing deadlines that might have otherwise been spent with them. I have the deepest gratitude for their forbearance, tolerance, and support over many decades that have made my contribution to this work possible.

*Final Words* — I have spent many decades compiling, writing, revising, and proofing the various editions of *Handbook on Injectable Drugs* and all the other works. To me, the *Handbook* has been a calling, a bedrock professional activity that I have always made paramount, and a true labor of love. From my original conception and design and throughout the tens of thousands of hours spent preparing the many editions of this work, I have always wanted to provide this resource for the benefit of the members of our profession and the patients they serve.

I have thought of the *Handbook* as a principal professional undertaking and contribution that I was here to perform. In *Ecclesiastes IX. 10.* it is written "Whatsoever thy hand findeth to do, do it with thy might." I have tried to conduct all of my professional undertakings, including the *Handbook*, in a manner consistent with this statement. Though much sacrifice of my time and other life goals was required, I have been willing, indeed eager, to continue this difficult and demanding undertaking over all these years in the knowledge that my efforts were providing a useful and valuable informational resource in patient care. For those many individuals, colleagues, and friends who have expressed their gratitude for my efforts, it is I who am grateful. I am grateful for those kind words that have encouraged me throughout the endless procession of late nights and early mornings, weekends, holidays, and vacations, all seemingly countless in number, spent on this undertaking. And to the members of the profession of pharmacy, especially those "in the trenches" of patient care who have found the *Handbook* useful, I am glad I could help. Thank you for this opportunity to serve.

However, the time has come to pass on this cherished work to others who are to continue it in the years to come. Although I will not be a part of the future of the *Handbook*, I will always take pride in my contributions of the past. So thank you again my colleagues and friends. It has been a pleasure.

LAT

December 2011

## Users Guide

**How to Use the Handbook** — *What Is the Handbook?* — The *Handbook on Injectable Drugs* is a collection of summaries of information from the published literature on the pharmaceuticals of parenteral medications as applied to the clinical setting. The *Handbook* is constructed from information derived from 2830 references with the information presented in the standardized structure described below. The purpose of the *Handbook* is to facilitate the use of this clinical pharmaceuticals research by knowledgeable health care professionals for the benefit of patients. The summary information from published research is supplemented with information from the labeling of each product and from other references.

The information base summarized in the *Handbook on Injectable Drugs* is large and highly complex, requiring thoughtful consideration for proper use. The *Handbook* is not, nor should it be considered, elementary in nature or a primer. A single quick glance in a table is not adequate for proper interpretation of this highly complex information base. Proper interpretation includes the obvious need to consider and evaluate all relevant research information and results. Additionally, information on the formulation components, product attributes (especially pH), and the known

stability behaviors of each parenteral drug, as well as the clinical situation of the patient, must be included in a thoughtful, reasoned evaluation of clinical pharmaceuticals questions.

*Who Should Use the Handbook?* — The *Handbook on Injectable Drugs* is designed for use as a professional reference and guide to the literature on the clinical pharmaceuticals of parenteral medications. The intended audience consists of knowledgeable health care professionals, particularly pharmacists, well versed in the formulation and clinical use of parenteral medications and who have the highly specialized knowledge base, training, and skills set necessary to interpret and apply the information. Practitioners who are not well versed in the formulation, essential properties, and clinical application of parenteral drugs should seek the assistance of more knowledgeable and experienced health care professionals to ensure patient safety.

Users of the *Handbook* must recognize that no reference work, including this one, can substitute for adequate decision-making by health care professionals. Proper clinical decisions must be made considering all aspects of the patient's condition and needs, with particular attention to the special demands imposed by parenteral medications. The *Handbook* cannot make decisions for its users. However, in knowledgeable hands, it is a valuable tool for the proper use of parenteral medications.

*Organization of the Handbook* — The *Handbook on Injectable Drugs* has been organized as a collection of monographs on each of the drugs. The monographs are arranged alphabetically by nonproprietary name. The names of the drugs follow the style of *USAN and the USP Dictionary of Drug Names*. Also included are some of the trade names and manufacturers of the drug products; this listing is not necessarily comprehensive and should not be considered an endorsement of any product or manufacturer.

All of the information included in the *Handbook* is referenced so that those who wish to study the original sources may find them. In addition, the *American Hospital Formulary Service* Classification System numbers have been included to facilitate the location of therapeutic information on the drugs.

The monographs have been divided into the subheadings described below:

**Products**-lists many of the sizes, strengths, volumes, and forms in which the drug is supplied, along with other components of the formulation. Instructions for reconstitution (when applicable) are included in this section.

The products cited do not necessarily constitute a comprehensive list of all available products. Rather, some common representative products are described. Furthermore, dosage forms, sizes, and container configurations of parenteral products may undergo significant changes during the lifespan of this edition of the *Handbook*.

Following the product descriptions, the pH of the drug products, the osmotic value(s) of the drug and/or dilutions (when available), and other product information such as the sodium content and definition of units are presented.

Practitioners have not always recognized the value and importance of incorporating product formulation information into the thought process that leads to their decision on handling drug compatibility and stability questions. However, consideration of the product information and formulation components as well as the properties and attributes of the products, especially pH, is essential to proper interpretation of the information presented in the *Handbook*.

**Administration**-includes route(s) by which the drug can be given, rates of administration (when applicable), and other related administration details.

The administration information is a condensation derived primarily from the product's official labeling and the *American Hospital Formulary Service*. For complete information, including dosage information sufficient for prescribing, the reader should refer to the official labeling and therapeutically comprehensive references such as the *American Hospital Formulary Service*.

**Stability**-describes the drug's stability and storage requirements. The storage condition terminology

of *The United States Pharmacopeia*, 34th ed., is used in the *Handbook on Injectable Drugs*.

*The United States Pharmacopeia* defines controlled room temperature as "A temperature maintained thermostatically that encompasses the usual and customary working environment of 20 ° to 25 °; that results in a mean kinetic temperature calculated to be not more than 25 °; and that allows for excursions between 15 ° and 30 ° that are experienced in pharmacies, hospitals, and warehouses."<sup>1</sup> (All temperatures are Celsius.)

Protection from excessive heat is often required; excessive heat is defined as any temperature above 40 °C. Similarly, protection from freezing may be required for products that are subject to loss of strength or potency, or destructive alteration of their characteristics in addition to the risk of container breakage.<sup>1</sup>

Some products may require storage at a cool temperature, which is defined as any temperature between 8 and 15 °C, or a cold temperature, which is defined as any temperature not exceeding 8 °C. A refrigerator is defined as a cold place in which the temperature is maintained thermostatically between 2 and 8 °C. Freezer storage refers to a place in which the temperature is maintained thermostatically between -25 and -10 °C.<sup>1</sup>

In addition to storage requirements, aspects of drug stability related to pH, freezing, and exposure to light are presented in this section. Also presented is information on repackaging of the drugs or their dilutions in container/closure systems other than the original package (e.g., prefilling into syringes or in ambulatory pumps). Sorption and filtration characteristics of the drugs are provided as well when this information is available. The information is derived principally from the primary published research literature and is supplemented by the product labeling and the *AHFS Drug Information*.

**Compatibility Information**-tabulates the results of published reports from primary research on the compatibility of the subject drug with infusion solutions and the other drugs. The various citations are listed alphabetically by solution or drug name; the information is completely cross-referenced among the monographs.

Four types of tables are utilized to present the available information, depending on the kind of test being reported. The first type is for information on the compatibility of a drug in various infusion solutions and is depicted in Table 1. The second type of table presents information on two or more drugs in intravenous solutions and is shown in Table 2. The third type of table is used for tests of two or more drugs in syringes and is shown in Table 3. The fourth table format is used for reports of simulated or actual injection into Y-sites and manifolds of administration sets and is shown in Table 4.

Many published articles, especially older ones, do not include all of the information necessary to complete the tables. However, the tables have been completed as fully as possible from the original articles.

**Table 1. Solution Compatibility**

Monograph drug name						
Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
(1)	(2)	(3)	(4)	(5)	(6)	(7)
1. Solution in which the test was conducted.						
2. Manufacturer of the solution.						
3. Manufacturer of the drug about which the monograph is written.						
4. Concentration of the drug about which the monograph is written.						
5. Description of the results of the test.						
6. Reference to the original source of the information.						
7. Designation of the compatibility (C) or incompatibility (I) of the test result according to conventional guidelines.

**Additional Compatibility Information**-provides additional information and discussions of compatibility presented largely in narrative form.

**Other Information**-contains any relevant auxiliary information concerning the drug which does not fall into the previous categories.

*The Listing of Concentration* – The concentrations of all admixtures in intravenous solutions in the tables have been indicated in terms of concentration per liter to facilitate comparison of the various studies. In some cases, this may result in amounts of the drug that are greater or lesser than those normally administered (as when the recommended dose is tested in 100 mL of vehicle), but the listings do accurately reflect the actual concentrations tested, expressed in standardized terms.

For studies involving syringes, the amounts actually used are indicated. The volumes are also listed if indicated in the original article.

For studies of actual or simulated Y-site injection of drugs, the concentrations are cited in terms of concentration per milliliter of each drug solution prior to mixing at the Y-site. Most published

research reports have presented the drug concentrations in this manner, and the *Handbook* follows this convention. For those few published reports that presented the drug concentrations after mixing at the Y-site, the concentrations have been recalculated to be consistent with the more common presentation style to maintain the consistency of presentation in the *Handbook*. Note that the Y-Site Injection Compatibility table is designed with the assumption of a 1:1 mixture of the subject drug and infusion solution or admixture. For citations reporting other than a 1:1 mixture, the actual amounts tested are specifically noted.

*Designating Compatibility or Incompatibility* — Each summary of a published research report appearing in the Compatibility Information tables bears a compatibility indicator (**C**, **I**, or **?**). A report receives a designation of **C** when the study results indicate that compatibility of the test samples existed under the test conditions. If the study determined an incompatibility existed under the test conditions, then an **I** designation is assigned for the *Handbook* entry for that study result. Specific standardized guidelines are used to assign these compatibility designations. The citation is designated as a report of compatibility when results of the original article indicated one or more of the following criteria were met: 1. Physical or visual compatibility of the combination was reported (no visible or electronically detected indication of particulate formation, haze, precipitation, color change, or gas evolution).

2. Stability of the components for at least 24 hours in an admixture under the specified conditions was reported (decomposition of 10% or less).
3. Stability of the components for the entire test period, although in some cases it was less than 24 hours, was reported (time periods less than 24 hours have been noted).

The citation is designated as a report of incompatibility when the results of the original article indicated either or both of the following criteria were met: 1. A physical or visual incompatibility was reported (visible or electronically detected particulate formation, haze, precipitation, color change, or gas evolution).

2. Greater than 10% decomposition of one or more components in 24 hours or less under the specified conditions was reported (time periods of less than 24 hours have been noted in the table).

Reports of test results that do not clearly fit into the compatibility or incompatibility definitions cannot be designated as either. These are indicated with a question mark.

Although these criteria have become the conventional definitions of compatibility and incompatibility, the reader should recognize that the criteria may need to be tempered with professional judgment. Inflexible adherence to the compatibility designations should be avoided. Instead, they should be used as aids in the exercising of professional judgment.

Therapeutic incompatibilities or other drug interactions are not within the scope of the *Handbook* and have not been included.

*Interpreting Compatibility Information in the Handbook* — As mentioned above, the body of information summarized in the *Handbook* is large and complicated. With the possible exception of a report of immediate gross precipitation, it usually takes some degree of thoughtful consideration and judgment to properly evaluate and appropriately act on the research results that are summarized in this book.

Nowhere is the need for judgment more obvious than when apparently contradictory information appears in two or more published reports. The body of literature in drug-drug and drug-vehicle compatibility is replete with apparently contradictory results. Except for study results that have been documented later to be incorrect, the conflicting information has been included in the *Handbook* to provide practitioners with all of the information for their consideration. The conflicting information will be readily apparent to the reader because of the content of the Remarks section as well as the **C**, **I**, and **?** designations following each citation.

Many or most of the apparently conflicting citations may be the result of differing conditions or

materials used in the studies. A variety of factors that can influence the compatibility and stability of drugs must be considered in evaluating such conflicting results, and absolute statements are often difficult or impossible to make. Differences in concentrations, buffering systems, preservatives, vehicles, temperatures, and order of mixing may all play a role. By reviewing a variety of reports, the user of the *Handbook* is better able to exercise professional judgment with regard to compatibility and stability.

The reader must guard against misinterpretation of research results, which may lead to extensions of compatibility and stability that are inappropriate. As an example, a finding of precipitate formation two hours after two drugs are mixed does not imply nor should it be interpreted to mean that the combination is compatible until that time point, when a sudden precipitation occurs. Rather, it should be interpreted to mean that precipitation occurred at some point between mixing and the first observation point at two hours. Such a result would lead to a designation of incompatibility in the *Handbook*.

Precipitation reports can be particularly troublesome for practitioners to deal with because of the variability of the time frames in which they may occur. Apart from combinations that repeatedly result in immediate precipitation, the formation of a precipitate can be unpredictable to some degree. Numerous examples of variable precipitation time frames can be found in the literature, including paclitaxel, etoposide, and sulfamethoxazole-trimethoprim in infusion solutions and calcium and phosphates precipitation in parenteral nutrition mixtures. Differing drug concentrations can also play a role in creating variability in results. A good example of this occurs with co-administered vancomycin hydrochloride and beta-lactam antibiotics. Users of the information in the *Handbook* must always be aware that a marginally incompatible combination might exhibit precipitation earlier or later than that reported in the literature. In many such cases, the precipitation is ultimately going to occur, it is just the timing that is in question. This is of particular importance for precipitate formation because of the potential for serious adverse clinical consequences, including death, which have occurred. Certainly, users of the *Handbook* information should always keep in mind and anticipate the possibility of precipitation and its clinical ramifications. Furthermore, all injections and infusions should be inspected for particulate matter and discoloration. If found, they should be discarded.

In addition, many research reports cite test solutions or concentrations that may not be appropriate for clinical use. An example would be a report of a drug's stability in unsterile water. Although the *Handbook* summary will accurately reflect the test solutions and conditions that existed in a study, it is certainly inappropriate to misinterpret a stability report like this as being an authorization to use the product clinically. In such cases, the researchers may have used the clinically inappropriate diluent to evaluate the drug's stability for extrapolation to a more suitable vehicle that is similar, or they may not have recognized that the diluent is clinically unsuitable. In either event, it is incumbent on the practitioner in the clinical setting to use professional judgment to apply the information in an appropriate manner and recognize what is not acceptable clinically.

Further, it should be noted that many of the citations designated incompatible are not absolute. While a particular admixture may incur more than 10% decomposition within 24 hours, the combination may be useful for a shorter time period. The concept of "utility time" or the time to 10% decomposition may be useful in these cases. Unfortunately, such information is often not available. Included in the Remarks columns of the tables are the amount of decomposition, the time period involved, and the temperature at which the study was conducted when this information is available.

Users of the *Handbook* information should always keep in mind that the information in the *Handbook* must be used as a tool and a guide to the research that has been conducted and published. It is not a replacement for thoughtfully considered professional judgment. It falls to the practitioner to interpret the information in light of the clinical situation, including the patient's needs and status. What is certain is that relying solely on the **C** or **I** designation without the application of professional judgment is inappropriate.

*Limitations of the Literature* — In addition to conflicting information, many of the published articles have provided only partial evaluations, not looking at all aspects of a drug's stability and compatibility. This is not surprising considering the complexity, difficulty, and costs of conducting such research. There are, in fact, some articles that do provide evaluations of both physical

stability/compatibility and chemical stability. But others are devoted only to physical issues, while others examine only chemical stability. Although a finding of precipitation, haze, or other physical effect may constitute an incompatibility (unless transient), the lack of such changes does not rule out chemical deterioration. In some cases, drugs initially designated as compatible because of a lack of visual change were later shown to undergo chemical decomposition. Similarly, the determination of chemical stability does not rule out the presence of unacceptable levels of particulates and/or turbidity in the combination. In a classic case, the drugs leucovorin calcium and fluorouracil were determined to be chemically stable for extended periods by stability-indicating HPLC assays in several studies, but years later, repeated episodes of filter clogging led to the discovery of unacceptable quantities of particulates in combinations of these drugs. The reader must always bear in mind these possibilities when only partial information is available.

And, finally, contemporary practitioners have come to expect that the analytical methods used in reports on the chemical stability of drugs will be validated stability-indicating methods. However, many early studies used methods that were not demonstrated to be stability indicating.

*Literature Search for Updating the Handbook* — To gather the bulk of the published compatibility and stability information for updating the *Handbook*, a literature search is performed using the *International Pharmaceutical Abstracts* database. By using key terms (e.g., stability), a listing of candidate articles for inclusion in the *Handbook* is generated. From this list, relevant articles are selected. As a supplement to this automated literature searching, a manual search of the references of the articles is also conducted, and any articles not included previously are obtained.

#### *Abbreviations* —

AA	Amino acids (percentage specified)
D	Dextrose solution (percentage unspecified)
D5LR	Dextrose 5% in Ringer's injection, lactated
D5R	Dextrose 5% in Ringer's injection
D-S	Dextrose-saline combinations
D2.5(1/2)S	Dextrose 2.5% in sodium chloride 0.45%
D2.5S	Dextrose 2.5% in sodium chloride 0.9%
D5(1/4)S	Dextrose 5% in sodium chloride 0.225%
D5(1/2)S	Dextrose 5% in sodium chloride 0.45%
D5S	Dextrose 5% in sodium chloride 0.9%
D10S	Dextrose 10% in sodium chloride 0.9%
D5W	Dextrose 5%
D10W	Dextrose 10%
IM	Isolyte M
IP	Isolyte P
LR	Ringer's injection, lactated
NM	Normosol M
NR	Normosol R
NS	Sodium chloride 0.9%
R	Ringer's injections
REF	Refrigeration
RT	Room temperature
S	Saline solution (percentage unspecified)
(1/2)S	Sodium chloride 0.45%
SL	Sodium lactate (1/6) M
W	Sterile water for injection

## Furosemide (FRUSEMIDE) - AHFS 40:28.08

**Products** — Furosemide is available in 2-, 4-, and 10-mL amber ampuls, single-use vials, prefilled syringes, and syringe cartridges. Each milliliter of solution contains furosemide 10 mg, water for injection, with sodium chloride for isotonicity, sodium hydroxide, and, if necessary, hydrochloric acid to adjust pH. <sup>(1-9/06)</sup> (4)

*pH* — From 8 to 9.3. <sup>(1-9/06)</sup> (4)

*Osmolality* — Furosemide (Hoechst-Roussel) 10 mg/mL has an osmolality of 287 mOsm/kg. <sup>(50)</sup> The osmolality of the Elkins-Sinn product has been determined to be 289 mOsm/kg by freezing-point depression. <sup>(1071)</sup>

In another study, the osmolality of furosemide injection (manufacturer unspecified) was determined to be 291 mOsm/kg. <sup>(1233)</sup>

*Sodium Content* — The injection contains 0.162 mEq of sodium per milliliter. <sup>(4)</sup>

*Trade Name(s)* — Lasix

**Administration** — Furosemide may be administered by intramuscular injection, by direct intravenous injection over one to two minutes, and by intravenous infusion at a rate not exceeding 4 mg/min. <sup>(1-9/06)</sup> (4)

**Stability** — Exposure to light may cause discoloration; protection from light for the syringes once they are removed from the package is recommended. Do not use furosemide solutions if they have a yellow color. Furosemide products should be stored at controlled room temperature. <sup>(1-9/06)</sup> (4) Refrigeration may result in precipitation or crystallization. However, resolubilization at room temperature or on warming may be performed without affecting the drug's stability. <sup>(593)</sup>

Furosemide under simulated summer conditions in paramedic vehicles was exposed to temperatures from 26 to 38 °C over 4 weeks. Analysis found no loss of drug under these conditions. <sup>(2562)</sup>

*pH Effects* — Furosemide is soluble in alkaline solutions and is prepared as a mildly buffered alkaline product. <sup>(1-9/06)</sup> (4) It can usually be mixed with infusion solutions that are neutral or weakly basic (pH 7 to 10) and with some weakly acidic solutions that have a low buffer capacity. <sup>(4)</sup> It should not be mixed with acidic solutions having a pH below 5.5. Solutions such as sodium chloride 0.9%, Ringer's injection, lactated, and dextrose 5% have been recommended. If the solution pH is below 5.5, pH adjustment has been recommended. <sup>(1-9/06)</sup> (4) In addition, furosemide has been found to be unstable in acidic media <sup>(96)</sup> <sup>(664)</sup> but very stable in basic media. <sup>(664)</sup>

A 2-mL fluid barrier of dextrose 5% in a microbore retrograde infusion set failed to prevent precipitation when used between gentamicin sulfate 5 mg/0.5 mL and furosemide 2 mg/0.2 mL. <sup>(1385)</sup>

*Autoclaving* — Autoclaving of furosemide 1 mg/mL in sodium chloride 0.9% in glass bottles at 115 °C for 34 minutes resulted in no loss of furosemide. Storage of the solution for 70 days at room temperature with protection from light also showed no detectable change in furosemide content. However, storage at room temperature with exposure to light for 70 days resulted in about a 60% loss of furosemide and the formation of a yellow-orange precipitate. <sup>(1108)</sup>

*Light Effects* — Furosemide is subject to photodegradation by several mechanisms. <sup>(358)</sup> <sup>(400)</sup> <sup>(2067)</sup> Photodegradation is minimized at pH 7; rates of decomposition increase as the pH becomes more acidic or basic. <sup>(400)</sup> <sup>(2067)</sup> Photodegradation is unaffected by ionic strength and initial concentration (in the range of 10 mcg/mL to 1 mg/mL), but the rate of loss may decrease at the higher

concentration due to a light-filtering effect of the yellow discoloration. In pH 7 phosphate buffer, more than 60% furosemide loss occurred in transparent glass vials exposed to fluorescent light for 90 hours; little or no loss occurred if the transparent vials were covered with aluminum foil or if amber glass containers were used. <sup>(2067)</sup>

*Syringes* — Furosemide (Hoechst) 10 mg/mL was filled into 25-mL polypropylene syringes (Becton Dickinson) and stored at 25 °C while exposed to normal room light or in the dark for 24 hours. There was no detectable change in furosemide content in either light-exposed or light-protected syringes. <sup>(1108)</sup>

Furosemide (Abbott) 1, 2, 4, and 8 mg/mL diluted in sodium chloride 0.9% was packaged in polypropylene syringes. Samples were stored for 84 days at 22 °C and also at 4 °C protected from light for 84 days. This was followed by an additional 7 days of storage at 22 °C exposed to fluorescent light. No visible changes occurred and little or no loss of furosemide occurred in any of the samples. <sup>(2389)</sup>

*Filtration* — Furosemide (Hoechst) 0.04 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22-µm cellulose ester membrane filter (Ivex-HP, Millipore) over six hours. No significant drug loss due to binding to the filter was noted. <sup>(1034)</sup>

*Central Venous Catheter* — Furosemide (American Regent) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Furosemide

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Amino acids 4.25%, dextrose 25%	MG	HO	40 mg	No increase in particulate matter in 24 hr at 25 °C	349	C
Dextrose 5% in Ringer's injection, lactated	BA	HO	600 mg	Physically compatible for 24 hr	315	C
Dextrose 5% in sodium chloride 0.9%	BA	HO	600 mg	Physically compatible for 24 hr	315	C
Dextrose 5%	BA	HO	600 mg	Physically compatible for 24 hr	315	C
Dextrose 5%			200 and 400 mg	4 to 5% loss in 24 hr at 25 °C	1348	C
Dextrose 10%	BA	HO	600 mg	Physically compatible for 24 hr	315	C
Dextrose 20%	BA	HO	600 mg	Physically compatible for 24 hr	315	C
Ringer's injection, lactated	BA	HO	600 mg	Physically compatible for 24 hr	315	C
Ringer's injection, lactated	TR <sup>a</sup>	HO	1 g	No furosemide loss in 24 hr at 25 °C exposed to light or in the dark	1108	C
Sodium chloride 0.9%	BA	HO	600 mg	Physically compatible for 24 hr	315	C
Sodium chloride 0.9%	TR <sup>a</sup>	HO	1 g	No furosemide loss in 24 hr at 25 °C exposed to light or in the dark. 10% loss in 26 days at 6 °C	1108	C
Sodium chloride 0.9%			200 and 400 mg	5 to 7% loss in 24 hr at 25 °C	1348	C

Sodium chloride 0.9%	BA <sup>a</sup>	AB	1.2, 2.4, 3.2 g	Visually compatible. Little loss in 84 days at 4 and 22 °C in dark then 7 days at 22 °C in fluorescent light	<a href="#">2389</a>	C
Sodium lactate (1/6) M	BA	HO	600 mg	Physically compatible for 24 hr	<a href="#">315</a>	C

<sup>a</sup>Tested in PVC containers.

### Additive Compatibility

#### Furosemide

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I

Meropenem	ZEN	1 and 20 g	HO	1 g	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C
Metoclopramide HCl	ANT	1 g	HO	1 g	NS	Precipitates immediately	<a href="#">1479</a>	I
Midazolam HCl	RC	50 and 250 mg		80 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Morphine sulfate	EV	1 g	HO	1 g	W	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Nitroglycerin	ACC	400 mg	HO	1 g	D5W <sup>b</sup>	Physically compatible with no nitroglycerin loss in 48 hr at 23 °C. Furosemide not tested	<a href="#">929</a>	C
Nitroglycerin	ACC	400 mg	HO	1 g	NS <sup>b</sup>	Physically compatible with 3% nitroglycerin loss in 48 hr at 23 °C. Furosemide not tested	<a href="#">929</a>	C
Potassium chloride	ANT	40 mmol	HO	1 g	W	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Prochlorperazine edisylate	MB	1.25 g	HO	1 g	W	Yellow precipitate forms immediately	<a href="#">1479</a>	I

Promethazine HCl	MB	5 g	HO	1 g	W	White precipitate forms immediately	<a href="#">1479</a>	I
Ranitidine HCl	GL	500 mg	HO	1 g	NS	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Ranitidine HCl	GL	50 mg and 2 g		400 mg	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Furosemide not tested	<a href="#">1515</a>	C
Scopolamine butylbromide	BI	2 g	HO	1 g	W	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Sodium bicarbonate	IMS	8.4%	HO	1 g		Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Theophylline		2 g		330 mg	D5W	Visually compatible. Little theophylline and 10% furosemide loss in 48 hr	<a href="#">1909</a>	C
Tobramycin sulfate	DI	1.6 g	HO	800 mg	D5W, NS	Transient cloudiness then physically compatible for 24 hr at 21 °C	<a href="#">876</a>	?
Tobramycin sulfate	LI	8 g	HO	1 g	NS	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Verapamil HCl	KN	80 mg	HO	200 mg	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C
Verapamil HCl	AB	500 mg	HO	1 g	NS	Slight precipitate forms but dissipates	<a href="#">1479</a>	?

<sup>a</sup>Tested in both polyolefin and PVC containers.

<sup>b</sup>Tested in glass containers.

<sup>c</sup>Tested in PVC containers.

### Drugs in Syringe Compatibility

#### Furosemide

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Bleomycin sulfate		1.5 units/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Caffeine citrate		20 mg/1 mL	AST	10 mg/1 mL	Precipitates immediately	<a href="#">2440</a>	I
Cisplatin		0.5 mg/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Cyclophosphamide		10 mg/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Dexamethasone sodium phosphate	ME	0.33 to 3.33 mg/mL	HO	3.33 to 10 mg/mL	Tested in NS. No visible precipitation with under 10% loss of either drug in 5 days at 4 and 25 °C. Precipitation with over 10%	<a href="#">2711</a>	C

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Dimenhydrinate		10 mg/1 mL		10 mg/1 mL	drug loss in 15 days Precipitate forms	<a href="#">2569</a>	I
Doxapram HCl	RB	400 mg/20 mL	HO	100 mg/10 mL	Immediate turbidity	<a href="#">1177</a>	I
Doxorubicin HCl		1 mg/0.5 mL		5 mg/0.5 mL	Precipitates immediately	<a href="#">980</a>	I
Droperidol		1.25 mg/0.5 mL		5 mg/0.5 mL	Precipitates immediately	<a href="#">980</a>	I
Fluorouracil		25 mg/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Heparin sodium		500 units/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Heparin sodium		2500 units/1 mL		20 mg/2 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Leucovorin calcium		5 mg/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Methotrexate sodium		12.5 mg/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Metoclopramide HCl		2.5 mg/0.5 mL		5 mg/0.5 mL	Precipitates immediately	<a href="#">980</a>	I
Milrinone lactate	WI	3.5 mg/3.5 mL	LY	40 mg/4 mL	Brought to 10-mL total volume with D5W. Precipitates immediately	<a href="#">1191</a>	I
Mitomycin		0.25 mg/0.5 mL		5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Pantoprazole sodium	<sup>a</sup>	4 mg/1 mL		10 mg/1 mL	Possible precipitate within 15 min	<a href="#">2574</a>	I
Vinblastine sulfate		0.5 mg/0.5 mL		5 mg/0.5 mL	Precipitates immediately	<a href="#">980</a>	I
Vincristine sulfate		0.5 mg/0.5 mL		5 mg/0.5 mL	Precipitates immediately	<a href="#">980</a>	I

<sup>a</sup>Test performed using the formulation WITHOUT edetate disodium.

### Y-Site Injection Compatibility (1:1 Mixture)

#### Furosemide

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Allopurinol sodium	BW	3 mg/mL <sup>b</sup>	ES	3 mg/mL <sup>b</sup>	Physically compatible for 4 hr at 22 °C	<a href="#">1686</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in sterile water for injection.

<sup>e</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>f</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>g</sup>Furosemide 0.5 mL injected in the Y-site port of a running infusion of labetalol hydrochloride in dextrose 5%.

<sup>h</sup>Tested in dextrose 5% with sodium bicarbonate 0.05 mEq/mL.

<sup>i</sup>Lyophilized formulation tested.

<sup>j</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>k</sup>Tested in dextrose 5% in sodium chloride 0.225%.

<sup>l</sup>Injected via Y-site into an administration set running azithromycin.

<sup>m</sup>Tested in Ringer's injection, lactated.

<sup>n</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>o</sup>Tested using premixed nitroglycerin infusion in dextrose 5% with citrate buffer (Baxter Healthcare).

<sup>p</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

Furosemide (FRUSEMIDE) - AHFS 40:28.08

## Fusidate Sodium - AHFS 8:12.28.92

**Products** — Fusidate sodium is available as a dry powder in vials containing 500 mg (equivalent to 480 mg of fusidic acid). It is packaged with a diluent vial containing 10 mL of phosphate-citrate buffer (pH 7.4 to 7.6). The drug should be reconstituted with the diluent and diluted further with sodium chloride 0.9% or other compatible diluent for administration. <sup>(38)</sup>

*Sodium and Phosphate Content* — Each vial of fusidate sodium contains 3.1 mmol of sodium and 1.1 mmol of phosphate. <sup>(38)</sup>

*Trade Name(s)* — Fucidin

**Administration** — Fusidate sodium is administered by slow intravenous infusion over not less than six hours if a superficial vein is employed. If a central venous line is used, the infusion should be given over two to four hours. The reconstituted fusidate sodium in 10 mL of buffer solution is diluted in 500 mL of sodium chloride 0.9% or other compatible infusion solution for administration. The drug must not be given by other routes. <sup>(38)</sup>

**Stability** — Fusidate sodium should be stored below 25 °C and protected from light. Reconstituted solutions that are added to 500 mL of compatible infusion solutions are stable for 24 hours at room temperature. Unused portions of the reconstituted solution should be discarded. <sup>(38)</sup>

Fusidate sodium reconstituted with the buffer solution to 50 mg/mL is physically incompatible with infusion solutions containing amino acids solutions, dextrose 20% or greater, and lipid infusions. <sup>(38)</sup>

Fusidate sodium (Leo) at a concentration of 0.125 mg/mL is stated to be physically incompatible with the following peritoneal dialysis solutions <sup>(1800)</sup> :

Dianeal PD2 with dextrose 1.36%

Dianeal PD3 with dextrose 1.36%

Dianeal with dextrose 3.86%

Peritoneal Dialysis Solution 6.36%

Peritoneal Dialysis Solution 6.36% + acetate

Peritoneal Dialysis Solution with dextrose 2.27%

*pH Effects* — Precipitation may occur upon dilution if the resulting pH is less than 7.4. <sup>(38)</sup>

*Freezing Solutions* — Fusidate sodium (Leo) 1 mg/mL in sodium chloride 0.9% and dextrose 5% is stated to be stable frozen at -20 °C for 24 hours followed by thawing in a microwave oven. <sup>(1800)</sup>

Fusidic acid (Leo) 500 mg, reconstituted in buffer and diluted to 550 mL in sodium chloride 0.9% in PVC bags, was stored frozen at -20 °C. No loss was found after 12 months of storage followed by microwave thawing. Furthermore, the solution was physically compatible, with no increase in subvisible particles. In addition, there was no loss of fusidate sodium after six months of storage at -20 °C followed by three freeze-thaw cycles. <sup>(1612)</sup>

Fusidate Sodium - AHFS 8:12.28.92

## Gallium Nitrate - AHFS 92:24

**Products** — Gallium nitrate is available in 20-mL vials. Each milliliter of solution contains gallium nitrate 25 mg, sodium citrate dihydrate 28.75 mg, and sodium hydroxide or hydrochloric acid for pH adjustment during manufacturing in water for injection. <sup>(1-2/08)</sup>

*pH* — 6 to 7. <sup>(1-2/08)</sup>

*Trade Name(s)* — Ganite

**Administration** — Gallium nitrate is administered by intravenous infusion over 24 hours after dilution in 1000 mL of dextrose 5% or sodium chloride 0.9%. <sup>(1-2/08)</sup>

**Stability** — Gallium nitrate in intact vials should be stored at controlled room temperature. The manufacturer states that unused portions of the vials should be discarded because no preservative is present. <sup>(1-2/08)</sup>

Gallium nitrate diluted in 1000 mL of dextrose 5% or sodium chloride 0.9% is stable for 48 hours at room temperature and for seven days stored under refrigeration. <sup>(1-2/08)</sup>

Gallium Nitrate - AHFS 92:24

## Ganciclovir Sodium - AHFS 8:18.32

**Products** — Ganciclovir sodium is available in vials containing, in dry form, the equivalent of ganciclovir 500 mg. Reconstitute with 10 mL of sterile water for injection and shake to dissolve the drug to yield a solution containing ganciclovir 50 mg/mL. Do not use paraben-containing diluents to reconstitute ganciclovir sodium because precipitation may result. <sup>(1-1/06)</sup>

*pH* — Approximately 11. <sup>(1-1/06)</sup>

*Sodium Content* — Each 500-mg vial contains 46 mg of sodium. <sup>(1-1/06)</sup>

*Trade Name(s)* — Cytovene-IV

**Administration** — Ganciclovir sodium is administered by intravenous infusion. After reconstitution, the dose may be diluted in 50 to 250 mL (usually 100 mL) of compatible infusion solution and given over one hour. Concentrations over 10 mg/mL are not recommended. Ganciclovir sodium should not be administered by intramuscular, subcutaneous, or rapid intravenous injection or infusion. <sup>(1-1/06)</sup> (4)

**Stability** — Intact vials should be stored at controlled room temperature and protected from temperatures above 40 °C. The reconstituted solution is stable for 12 hours at room temperature. Refrigeration of the reconstituted solution is not recommended because of possible precipitation. <sup>(1-1/06)</sup> (4) However, ganciclovir sodium 500 mg/10 mL in sterile water for injection had no significant loss in 60 days when stored at 4 °C. <sup>(1637)</sup>

Ganciclovir sodium (Syntex) 0.35 mg/mL diluted in sodium chloride 0.9% and stored at 22 °C did not exhibit a substantial antimicrobial effect on the growth of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. *S. aureus* and *C. albicans* remained viable for 24 hours, and the others remained viable to the end of the study at 120 hours. The author recommended that diluted solutions of ganciclovir sodium be stored under refrigeration whenever possible and that the potential for microbiological growth should be considered when assigning expiration periods. <sup>(2160)</sup>

*Freezing Solutions* — The manufacturer does not recommend freezing ganciclovir sodium solutions. <sup>(1-1/06)</sup> However, ganciclovir sodium (Syntex) 1.4, 4, and 7 mg/mL in sodium chloride 0.9% packaged in polypropylene syringes and 0.28 and 1.4 mg/mL in sodium chloride 0.9% packaged in PVC containers was evaluated. All samples exhibited 4% or less drug loss after 364 days at -20 °C. <sup>(1836)</sup>

No ganciclovir sodium loss occurred in a 10-mg/mL solution in sodium chloride 0.9% in 48 weeks when stored frozen at -8 °C. <sup>(2595)</sup>

*Syringes* — Ganciclovir sodium (Syntex) 5.8 mg/mL in sodium chloride 0.9%, packaged in polypropylene infusion-pump syringes (Healthtek), exhibited 3% or less drug loss in 10 days at 4 °C and no loss in 12 hours at 25 °C. <sup>(1742)</sup>

Ganciclovir sodium (Syntex) 1.4, 4, and 7 mg/mL in sodium chloride 0.9% was packaged in polypropylene syringes and stored at 20, 4, and -20 °C. Drug loss occurred of 4% or less in seven days at 20 °C, in 80 days at 4 °C, and in 364 days at -20 °C. <sup>(1836)</sup>

*Central Venous Catheter* — Ganciclovir sodium (Roche) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Ganciclovir sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%				Physically and chemically compatible	<a href="#">1(1/06)</a>	C
Dextrose 5%	TR <sup>a</sup>	SY	2.44 g	Physically compatible with no loss in 5 days at 25 °C in light or dark and at 4 °C	<a href="#">1288</a>	C

## Gemcitabine Hydrochloride - AHFS 10:00

**Products** — Gemcitabine hydrochloride is available as a lyophilized powder in vials containing 200 mg of drug (as the base) with mannitol 200 mg and sodium acetate 12.5 mg. Reconstitute the 200-mg vial with 5 mL of sodium chloride 0.9% (without preservatives) and shake to dissolve the powder. <sup>(1-5/07)</sup>

Gemcitabine hydrochloride is also available as a lyophilized powder in vials containing 1 g of drug (as the base) with mannitol 1 g and sodium acetate 62.5 mg. Reconstitute the 1-g vial with 25 mL of sodium chloride 0.9% (without preservatives) and shake to dissolve the powder. <sup>(1-5/07)</sup>

When reconstituted as directed, the resulting solution from either size vial has a gemcitabine concentration of 38 mg/mL, which accounts for the displacement volume of the powder. The total volumes after reconstitution will be 5.26 mL for the 200-mg vial and 26.3 mL for the 1-g vial. <sup>(1-5/07)</sup>

Because of the drug's aqueous solubility, reconstitution to concentrations higher than 40 mg/mL may result in incomplete dissolution and should be avoided. <sup>(1-5/07)</sup>

The pH of the products may have been adjusted by the manufacturer with sodium hydroxide and/or hydrochloric acid. <sup>(1-5/07)</sup>

*pH* — The reconstituted solution has a pH in the range of 2.7 to 3.3. <sup>(1-5/07)</sup>

*Trade Name(s)* — Gemzar

**Administration** — Gemcitabine hydrochloride is administered weekly by intravenous infusion over 30 minutes. It may be administered as reconstituted or diluted further in additional sodium chloride 0.9% to a concentration as low as 0.1 mg/mL. <sup>(1-5/07)</sup>

**Stability** — Gemcitabine hydrochloride in intact vials should be stored at controlled room temperature. The white lyophilized powder becomes a colorless to light straw-colored solution on reconstitution. The manufacturer states that the reconstituted solution is stable for 24 hours at controlled room temperature. Unused solution should be discarded. <sup>(1-5/07)</sup> However, other information indicates the reconstituted solution may be stable for longer periods. <sup>(2227)</sup> See Reconstituted Solutions below. The reconstituted solution should not be refrigerated because crystallization may occur. <sup>(1-5/07)</sup>

Gemcitabine hydrochloride (Lilly) 2.4 mg/mL diluted in sodium chloride 0.9% and stored at 22 °C did not exhibit a substantial antimicrobial effect on the growth of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. *C. albicans* maintained viability for 120 hours, and the others were viable for 24 hours. The author recommended that diluted solutions of gemcitabine hydrochloride be stored under refrigeration whenever possible and that the potential for microbiological growth should be considered when assigning expiration periods. <sup>(2160)</sup>

*Reconstituted Solutions* — Gemcitabine hydrochloride (Lilly) 200-mg and 1-g vials reconstituted to 38 mg/mL with sterile water for injection and also sodium chloride 0.9% were evaluated over periods of 35 days at 23 °C exposed to and protected from fluorescent light and at 4 °C protected from light. The samples stored at 23 °C were physically stable throughout the study period. Under 4% loss occurred in 35 days at 23 °C. When refrigerated, the solutions remained physically and chemically stable for at least seven days, but large colorless crystals formed in some samples after that time. The crystals did not redissolve on warming to room temperature. No loss occurred in the refrigerated solutions unless crystals formed; gemcitabine losses of 20 to 35% were determined in samples containing crystals. Exposure to or protection from fluorescent light did not affect gemcitabine stability. <sup>(2227)</sup>

*Syringes* — Gemcitabine hydrochloride (Lilly) 38 mg/mL in sodium chloride 0.9% was repackaged as 10 mL of solution in 20-mL polypropylene plastic syringes (Becton Dickinson) and sealed with tip caps (Red Cap, Burrton). Sample syringes were stored at 23 °C both exposed to and protected from fluorescent light and at 4 °C protected from light for 35 days. All samples were physically stable throughout the study period. Although not observed in these solutions packaged in plastic syringes, reconstituted solutions stored under refrigeration are subject to possible crystal formation. No loss occurred in 35 days under any of the conditions. <sup>(2227)</sup>

*Sorption* — Gemcitabine hydrochloride has not exhibited any incompatibilities with bottles or PVC bags and administration sets. <sup>(1-5/07)</sup>

Gemcitabine hydrochloride (Lilly) 5.12 mg/mL in sodium chloride 0.9% exhibited no loss due to sorption in polyethylene and PVC containers compared to glass containers over 48 hours at room temperature. <sup>(2420) (2430)</sup>

## Compatibility Information

### Solution Compatibility

Gemcitabine Hydrochloride - AHFS 10:00

## Gentamicin Sulfate - AHFS 8:12.02

**Products** — Gentamicin (as the sulfate) is available at a concentration of 40 mg/mL in 2- and 20-mL vials. The drug is also available at a concentration of 10 mg/mL for pediatric use. The products may also contain edetate disodium, sodium bisulfite, and parabens. <sup>(1-10/04)</sup> (4)

Gentamicin sulfate is also available from several manufacturers premixed in various concentrations in sodium chloride 0.9%. <sup>(4)</sup>

*pH* — The injection for intravenous or intramuscular administration has a pH of 3 to 5.5. Premixed infusions of gentamicin sulfate in sodium chloride 0.9% have a pH of around 4 to 4.5. <sup>(4)</sup>

*Osmolality* — Gentamicin sulfate (Wyeth) 40 mg/mL has an osmolality of 160 mOsm/kg. <sup>(50)</sup> Gentamicin sulfate pediatric injection (Elkins-Sinn) 10 mg/mL has an osmolality of 116 mOsm/kg by freezing-point depression or 212 mOsm/kg by vapor pressure. <sup>(1071)</sup>

The osmolality of gentamicin sulfate 1 mg/mL was 262 mOsm/kg in dextrose 5% and 278 mOsm/kg in sodium chloride 0.9%. At a 2.5-mg/mL concentration, the osmolality was 278 mOsm/kg in dextrose 5% and 293 mOsm/kg in sodium chloride 0.9%. <sup>(1375)</sup>

The osmolality of gentamicin sulfate 80 mg was calculated for the following dilutions <sup>(1054)</sup> :

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	293	285
Sodium chloride 0.9%	320	315

The osmolarity of the premixed infusions in sodium chloride 0.9% is approximately 284 to 308 mOsm/L. <sup>(4)</sup>

**Administration** — Gentamicin sulfate is administered by intramuscular injection or intermittent intravenous infusion over 0.5 to two hours. For adults, intravenous administration in 50 to 200 mL of sodium chloride 0.9% or dextrose 5% is recommended, while the volume for pediatric patients should be reduced to meet patient's needs. <sup>(1-10/04)</sup> (4)

**Stability** — Gentamicin sulfate injection is colorless to slightly yellow. <sup>(4)</sup> Intact containers should be stored at controlled room temperature and protected from freezing. <sup>(1-10/04)</sup> (4) Drug concentration is unrelated to color intensity of gentamicin sulfate solutions. <sup>(2139)</sup>

*Freezing Solutions* — Gentamicin sulfate (Schering) 50 mg in 50 mL of dextrose 5% and also sodium chloride 0.9% in PVC containers frozen at -20 °C was stable for 30 days. <sup>(299)</sup>

Gentamicin sulfate (Schering) 80 mg/100 mL of dextrose 5% in PVC bags was frozen at -20 °C for 30 days and then thawed by exposure to ambient temperature or microwave radiation. No precipitation or color change was observed, and no drug loss occurred. Subsequent storage of the admixture at room temperature for 24 hours also yielded a physically compatible solution, exhibiting little or no drug loss. <sup>(554)</sup>

Gentamicin sulfate (Elkins-Sinn) 120 mg/50 mL lost 6% in dextrose 5% and 2% in sodium chloride 0.9% in 28 days when frozen at -20 °C. <sup>(981)</sup>

The stability of gentamicin sulfate (Schering) 5.45 mg/mL in dextrose 5% frozen in an ambulatory pump reservoir was studied. The drug-filled reservoirs were stored at -20 °C for 30 days and then thawed at 5 °C for four days. This thawing was then followed by two days of drug delivery through the pump at 37 °C. No visible changes and no loss occurred during storage and delivery.

Furthermore, plasticizer (DEHP) levels were insignificant.<sup>(1490)</sup>

*Syringes* — The stability of gentamicin sulfate (Schering) repackaged in plastic syringes (Monoject) was significantly less than in glass syringes (Glaspak, Becton Dickinson) at both 4 and 25 °C. The commercial concentrations were tested in the following amounts: 40 mg/mL-1, 0.75, 0.5, and 0.25 mL; and 10 mg/mL-1.5, 1, and 0.5 mL. Storage in plastic syringes resulted in an average loss of 16% in 30 days and in the formation of a brown precipitate. In glass syringes, the average loss was 7% at 30 days. The brown precipitate did not appear after 30 days but was present at 60 days. It appeared in the cannula of the needle in both glass and plastic syringes. For the 40-mg/mL concentration, the volume of the sample also affected stability. Significantly less loss was noted in the smaller volumes (0.25 and 0.5 mL) than in the larger volumes (0.5 and 1 mL). This volume-related phenomenon was not demonstrated in the 10-mg/mL pediatric concentration. Storage temperature had no effect on stability over 90 days.<sup>(297)</sup>

The manufacturer also expressed concern about plastic packaging of gentamicin, noting a possibly inadequate oxygen and moisture barrier both through the tip and the walls of the syringe. It was indicated that gentamicin is oxygen sensitive and that depletion of the antioxidant present could result in instability. Further, loss of moisture at the tip could result in occlusion by the dried product.<sup>(403)</sup>

Gentamicin sulfate 40 mg/1 mL was packaged in polypropylene syringes (Plastipak, Becton Dickinson). No significant change in concentration occurred over 30 days at 4 or 25 °C.<sup>(401)</sup>

Gentamicin sulfate (Elkins-Sinn) 120 mg, diluted with 1 mL of sodium chloride 0.9% to a final volume of 4 mL, was stable (less than 10% loss) when stored in polypropylene syringes (Becton Dickinson) for 48 hours at 23 °C under fluorescent light.<sup>(1159)</sup>

The stability of gentamicin sulfate (Elkins-Sinn) diluted to 10 mg/mL with sodium chloride 0.9% and stored in glass syringes (Becton Dickinson) at 4 °C was studied. No loss of gentamicin sulfate was found during 12 weeks of storage.<sup>(1265)</sup>

*Sorption* — Gentamicin sulfate was shown not to exhibit sorption to PVC bags and tubing, polyethylene bags and tubing, multilayer bags of polyethylene, polyamide, and polypropylene, Silastic tubing, polypropylene syringes, and elastomeric reservoirs.<sup>(536) (606) (2014) (2269)</sup>

*Filtration* — The effect of several filters on the delivered concentration of gentamicin sulfate (Roussel) from simulated pediatric infusions was studied. A syringe containing dextrose 10% on a syringe pump set at 8.26 mL/hr was connected by intravenous tubing to a 0.5- $\mu$ m air-blocking filter set (Travenol), a 0.22- $\mu$ m air-eliminating filter set (Travenol), and a 0.2- $\mu$ m air-eliminating filter set (Pall). Gentamicin doses of 2.5 and 7.5 mg were injected antegrade to the filter. The effluents were sampled at 1, 1.5, 2, and 4 hours. No significant drug sorption to the plastic tubing or inline filters occurred. However, because of the difference in specific gravity of the drug (1.010) and intravenous solution (1.032), variations in delivered gentamicin did occur due to filter design and position. With the Travenol filters, gentamicin delivery was more rapid with ascending flow in both horizontal and vertical positions. Drug delivery was significantly delayed with descending flow in both positions. The Pall filter delivered gentamicin more rapidly in the horizontal position with either ascending or descending flow. The vertical filter position significantly delayed drug delivery in both flow directions.<sup>(804)</sup>

However, in another study, gentamicin sulfate 60 mg/15 mL was injected as a bolus through a 0.2- $\mu$ m nylon air-eliminating filter (Ultipor, Pall) to evaluate the effect of filtration on simulated intravenous push delivery. About 38% of the drug was delivered through the filter after flushing with 10 mL of sodium chloride 0.9%.<sup>(809)</sup>

Gentamicin sulfate 5 and 10 mg/55 mL of dextrose 5% and sodium chloride 0.9% was filtered over 20 minutes through a 0.22- $\mu$ m cellulose ester filter set (Ivex-2, Millipore). Virtually all of the drug was delivered through the filter.<sup>(1003)</sup>

The binding of gentamicin sulfate to the filter of a set used for continuous ambulatory peritoneal dialysis (CAPD) was studied. Gentamicin sulfate 60 mg/2 L in Dianeal 137 with dextrose 4.25 and 1.5% was filtered through a Peridex CAPD filter set (Millipore); this set has a surface area 27 times larger than an inline intravenous filter. About 25% binding occurred from the solution containing dextrose 4.25%, but only 7.5% was bound with the 1.5% solution. <sup>(1112)</sup>

Gentamicin sulfate (Unicet-Unilabo) 0.32 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22-µm cellulose ester membrane filter (Ivex-HP, Millipore) over six hours. No significant drug loss due to binding to the filter was noted. <sup>(1034)</sup>

*Central Venous Catheter* — Gentamicin sulfate (Fujisawa) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Gentamicin sulfate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Amino acids 4.25%, dextrose 25%	MG	SC	80 mg	No increase in particulate matter in 24 hr at 5 °C	349	C
Dextrose 5%		RS	160 mg	Stable for 48 hr at room temperature	157	C

TPN #22 <sup>d</sup>		SC 800 mg	Physically compatible. No loss in 24 hr at 22 °C in the dark	<a href="#">837</a>	C
TPN #52 and TPN #53 <sup>d</sup>		SC 50 mg	Physically compatible. No loss in 24 hr at 29 °C	<a href="#">440</a>	C
TPN #107 <sup>d</sup>		75 mg	Physically compatible and stable for 24 hr at 21 °C	<a href="#">1326</a>	C

<sup>a</sup>Tested in both glass and PVC containers.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Tested in glass vials as a concentrate.

<sup>d</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

### Additive Compatibility

#### Gentamicin sulfate

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Amphotericin B		200 mg		320 mg	D5W	Haze develops over 3 hr	<a href="#">26</a>	I
Ampicillin sodium	BE	8 g	RS	160 mg	D5(1/4)S, D5W, NS	50% gentamicin loss in 2 hr at room temperature	<a href="#">157</a>	I
Ampicillin sodium		1 g		100 mg	TPN #107 <sup>a</sup>	42% gentamicin loss and 25% ampicillin loss in 24 hr at 21 °C	<a href="#">1326</a>	I
Atracurium besylate	BW	500 mg		2 g	D5W	Physically compatible and atracurium stable for 24 hr at 5 and 30 °C	<a href="#">1694</a>	C
Aztreonam	SQ	10 and 20 g	SC	200 and 800 mg	D5W, NS <sup>b</sup>	Little aztreonam loss in 48 hr at 25 °C and 7 days at 4 °C. Gentamicin stable for 12 hr at 25 °C and 24 hr at 4 °C. Up to 10% loss in 48 hr at 25 °C and 7 days at 4 °C	<a href="#">1023</a>	C
Bleomycin sulfate	BR	20 and 30 units	SC	50, 100, 300, 600 mg	NS	Physically compatible and bleomycin activity retained for 1 week at 4 °C. Gentamicin not tested	<a href="#">763</a>	C
Cefazolin sodium <sup>f</sup>	SKF	10 g	ES	800 mg	D5W, NS <sup>c</sup>	10% cefazolin loss in 4 hr in D5W and 12 hr in NS at 25 °C. No clindamycin and gentamicin loss in 24 hr	<a href="#">1328</a>	I
Cefepime HCl	BR	40 g	ES	1.2 g	D5W, NS	Cloudy in 18 hr at room temperature	<a href="#">1681</a>	I
Cefotaxime sodium	RS	50 mg	SC	9 mg	D5W	30% loss of gentamicin in 2 hr at 22 °C	<a href="#">504</a>	I

Cefotaxime sodium	RS	50 mg	SC	6 mg	D5W	4% loss of gentamicin in 24 hr at 22 °C	<a href="#">504</a>	C
Cefoxitin sodium	MSD	5 g	SC	400 mg	D5S	4% cefoxitin loss in 24 hr and 11% in 48 hr at 25 °C. 2% in 48 hr at 5 °C. 9% gentamicin loss in 24 hr and 23% in 48 hr at 25 °C. 2% in 48 hr at 5 °C	<a href="#">308</a>	C
Ceftazidime	GL	50 mg	SC	6 and 9 mg	D5W	10 to 20% gentamicin loss in 2 hr at 22 °C	<a href="#">504</a>	I
Ceftriaxone sodium	RC	100 mg	SC	9 mg	D5W	13% loss of gentamicin in 8 hr at 22 °C	<a href="#">504</a>	I
Ceftriaxone sodium	RC	100 mg	SC	6 mg	D5W	5% loss of gentamicin in 24 hr at 22 °C	<a href="#">504</a>	C
Cefuroxime sodium	GL	7.5 g	EX	800 mg	D5W, NS <sup>b</sup>	Physically compatible with no loss of either drug in 1 hr	<a href="#">1036</a>	C
Cefuroxime sodium		1 g		100 mg	TPN #107 <sup>a</sup>	32% gentamicin loss in 24 hr at 21 °C	<a href="#">1326</a>	I
Ciprofloxacin	MI	1.6 g	LY	1 g	D5W, NS	Visually compatible and both drugs stable for 48 hr at 25 °C under fluorescent light and 4 °C in the dark	<a href="#">1541</a>	C
Ciprofloxacin	BAY	2 g	SC	10 g	NS	Visually compatible. Little ciprofloxacin loss in 24 hr at 25 °C. Gentamicin not tested	<a href="#">1934</a>	C
Ciprofloxacin	BAY	2 g	SC	1.6 g	D5W	Visually compatible with no loss of ciprofloxacin in 24 hr at 22 °C under fluorescent light. Gentamicin not tested	<a href="#">2413</a>	C
Clindamycin phosphate	UP	2.4 g		120 mg	D5W	Physically compatible. Clindamycin stable for 24 hr at room temperature	<a href="#">104</a>	C
Clindamycin phosphate	UP	1.2 g		60 mg	D5W	Physically compatible. Clindamycin stable for 24 hr at room temperature	<a href="#">104</a>	C
Clindamycin phosphate	UP	12 g		600 mg	D5W	Physically compatible	<a href="#">101</a>	C
Clindamycin phosphate	UP	9 g		800 mg	D5W	Clindamycin stable for 24 hr	<a href="#">101</a>	C
Clindamycin phosphate	UP	9 g	AB	1 g	D5W, NS <sup>d</sup>	Physically compatible and both drugs stable for 48 hr at room temperature exposed to light and 1 week frozen	<a href="#">174</a>	C
Clindamycin phosphate	UP	9 g	LY	1.2 g	D5W <sup>c</sup>	Physically compatible and both drugs stable for 7 days at 4 and 25 °C	<a href="#">174</a>	C
Clindamycin phosphate	UP	9 g	LY	1.2 g	NS <sup>c</sup>	Physically compatible and both drugs stable for 14 days at 4 and 25 °C	<a href="#">174</a>	C
Clindamycin phosphate	UP	18 g	LY	2.4 g	D5W, NS <sup>b</sup>	Physically compatible and both drugs stable for 14 days at 4 and 25 °C	<a href="#">174</a>	C

Clindamycin phosphate	UP	9 g	ES	1.2 g	D5W, NS <sup>c</sup>	Physically compatible and both drugs stable for 28 days frozen at -20 °C	<a href="#">174</a>	C
Clindamycin phosphate	UP	18 g	ES	2.4 g	D5W, NS <sup>b</sup>	Both drugs stable for 28 days frozen at -20 °C	<a href="#">981</a>	C
Clindamycin phosphate	UP	6 g	ES	667 mg	D5W <sup>b</sup>	Physically compatible with no clindamycin loss and 9% gentamicin loss in 24 hr at room temperature	<a href="#">995</a>	C
Clindamycin phosphate		400 mg		75 mg	TPN #107 <sup>a</sup>	19% gentamicin loss and 15% clindamycin loss in 24 hr at 21 °C	<a href="#">1326</a>	I
Clindamycin phosphate <sup>g</sup>	UP	9 g	ES	800 mg	D5W, NS <sup>c</sup>	10% cefazolin loss in 4 hr in D5W and 12 hr in NS at 25 °C. No clindamycin and gentamicin loss in 24 hr	<a href="#">1328</a>	I
Cloxacillin sodium	BE	4 g	RS	160 mg	D5(1/4)S, D5W, NS	Precipitate forms	<a href="#">157</a>	I
Cytarabine	UP	100 mg		80 mg	D5W	Physically compatible for 24 hr	<a href="#">174</a>	C
Cytarabine	UP	300 mg		240 mg	D5W	Physically incompatible	<a href="#">174</a>	I
Dextran 40		10%			D5W	Gentamicin stable for 24 hr at room temperature	<a href="#">227</a>	C
Dopamine HCl	AS	800 mg	SC	2 g	D5W	No dopamine and 7% gentamicin loss in 24 hr at 25 °C	<a href="#">312</a>	C
Dopamine HCl	AS	800 mg	SC	320 mg	D5W	Gentamicin stable through 6 hr. 80% gentamicin loss in 24 hr at 25 °C. Dopamine stable for 24 hr	<a href="#">78</a>	I
Fat emulsion, intravenous	VT	10%	RS	160 mg		Lipid coalescence in 24 hr at 8 and 25 °C	<a href="#">825</a>	I
Floxacillin sodium	BE	20 g	RS	8 g	NS	Haze forms immediately and precipitate forms in 2 hr	<a href="#">1479</a>	I
Floxacillin sodium	BE	10 g	EX	8 g	NS	Physically compatible for 48 hr. Both drugs stable for 1 hr at room temperature	<a href="#">1036</a>	C
Floxacillin sodium	BE	10 g	EX	8 g	D5W	Precipitates immediately	<a href="#">1036</a>	I
Fluconazole	PF	1 g	SO	0.5 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25 °C under fluorescent light. Gentamicin not tested	<a href="#">1677</a>	C
Furosemide	HO	800 mg	SC	1.6 g	D5W, NS	Furosemide precipitates immediately	<a href="#">876</a>	I
Furosemide	HO	1 g	RS	8 g	NS	Physically compatible for 24 hr at 15 and 30 °C. Precipitate forms in 48 to 72 hr	<a href="#">1479</a>	C
Fusidate sodium	LEO	1 g		160 mg	D-S	Physically compatible and chemically stable for 48 hr at room temperature	<a href="#">1800</a>	C

Fusidate sodium	LEO	1 g		1.5 g	D-S	Physically incompatible	<a href="#">1800</a>	I
Heparin sodium	BP	20,000 units		320 mg	D5W, NS	Precipitates immediately	<a href="#">26</a>	I
Heparin sodium	OR	20,000 units	SC	1 g	D5W, NS	Opalescence	<a href="#">113</a>	I
Heparin sodium	BRN	1000 to 6000 units	ME	88 mg	D10W, NS	Activity of both drugs greatly reduced	<a href="#">1570</a>	I
Linezolid	PHU	2 g	AB	800 mg	<a href="#">e</a>	Physically compatible. Little linezolid loss in 7 days at 4 and 23 °C in dark. Gentamicin losses of 5 to 7% in 7 days at 4 °C and 8% in 5 days at 23 °C	<a href="#">2332</a>	C
Mannitol		20%		120 mg		Physically compatible and gentamicin stable for 24 hr at 25 °C	<a href="#">897</a>	C
Meropenem	ZEN	1 and 20 g	SC	800 mg	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C
Metronidazole	SE	5 g	SC	800 mg and 1.2 g		Physically compatible with no loss of either drug in 2 days at 18 °C. At 4 °C, no metronidazole loss but up to 10% gentamicin loss in 7 days	<a href="#">1242</a>	C
Metronidazole	RP	5 g		800 mg		Visually compatible with no loss of metronidazole in 15 days at 5 and 25 °C. 10% gentamicin loss in 63 hr at 25 °C and 10.6 days at 5 °C	<a href="#">1931</a>	C
Midazolam HCl	RC	50, 250, 400 mg	EX	800 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Nafcillin sodium		1 g		75 mg	TPN #107 <sup>a</sup>	10% gentamicin loss in 24 hr at 21 °C	<a href="#">1326</a>	I
Penicillin G sodium	GL	13 and 40 million units	RS	160 mg	D5(1/4)S, D5W, NS	Gentamicin stable for 24 hr at room temperature	<a href="#">157</a>	C
Ranitidine HCl	GL	100 mg		160 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	<a href="#">1151</a>	C
Ranitidine HCl	GL	50 mg and 2 g		80 mg	D5W, NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Gentamicin not tested	<a href="#">1515</a>	C
Verapamil HCl	KN	80 mg	SC	160 mg	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C

<sup>a</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Tested in glass containers.

<sup>d</sup>Tested in both glass and PVC containers.

<sup>e</sup>Admixed in the linezolid infusion container.

<sup>f</sup>Tested in combination with clindamycin phosphate 9 g/L.

<sup>g</sup>Tested in combination with cefazolin sodium 10 g/L.

### Drugs in Syringe Compatibility

#### Gentamicin sulfate

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Ampicillin sodium	AY	500 mg		80 mg/2 mL	Physically incompatible within 1 hr at room temperature	99	I
Caffeine citrate		20 mg/1 mL	ES	10 mg/1 mL	Visually compatible for 4 hr at 25 °C	2440	C
Clindamycin phosphate	UP	900 mg/6 mL	ES	120 mg/4 mL <sup>a</sup>	Physically compatible with little loss of either drug for 48 hr at 25 °C	1159	C
Cloxacillin sodium	BE	250 mg		80 mg/2 mL	Physically incompatible within 1 hr at room temperature	99	I
Dimenhydrinate		10 mg/1 mL		10 mg/1 mL	Clear solution	2569	C
Dimenhydrinate		10 mg/1 mL		40 mg/1 mL	Clear solution	2569	C
Heparin sodium		2500 units/1 mL		40 mg	Turbidity or precipitate forms within 5 min	1053	I
Iohexol	WI	64.7%, 5 mL	SC	0.8 mg/1 mL	Physically compatible for at least 2 hr	1438	C
Iopamidol	SQ	61%, 5 mL	SC	0.8 mg/1 mL	Physically compatible for at least 2 hr	1438	C
Iothalamate meglumine	MA	60%, 5 mL	SC	0.8 mg/1 mL	Physically compatible for at least 2 hr	1438	C
Ioxaglate meglumine-ioxaglate sodium	MA	5 mL	SC	0.8 mg/1 mL	Transient precipitate clears within 5 min	1438	?
Pantoprazole sodium	<sup>b</sup>	4 mg/1 mL		40 mg/1 mL	Whitish precipitate	2574	I
Penicillin G sodium		1 million units		80 mg/2 mL	No precipitate or color change within 1 hr at room temperature	99	C

<sup>a</sup>Diluted to 4 mL with 1 mL of sodium chloride 0.9%.

<sup>b</sup>Test performed using the formulation WITHOUT edetate disodium.

### Y-Site Injection Compatibility (1:1 Mixture)

#### Gentamicin sulfate

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Acyclovir sodium	BW	5 mg/mL <sup>a</sup>	TR	1.6 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 25 °C	1157	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in dextrose 5%, Ringer's injection, lactated, sodium chloride 0.45%, and sodium chloride 0.9%.

<sup>e</sup>Tested in sodium chloride 0.45%.

<sup>f</sup>Tested in dextrose 5% with albumin human 2 mg/mL.

<sup>g</sup>Tested in sterile water for injection.

<sup>h</sup>Lyophilized formulation tested.

<sup>i</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>j</sup>A 32.5-mL sample of parenteral nutrition solution mixed with 50 mL of antibiotic solution.

<sup>k</sup>Run at 21 mL/hr.

<sup>l</sup>Given over 30 minutes by syringe pump.

<sup>m</sup>Run at 94 mL/hr.

<sup>n</sup>Run at 10 mL/hr.

<sup>o</sup>Given over one hour by syringe pump.

<sup>p</sup>Injected via Y-site into an administration set running azithromycin.

<sup>q</sup>Tested in Ringer's injection, lactated.

<sup>r</sup>Final concentration after mixing.

<sup>s</sup>Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>t</sup>Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>u</sup>Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix I).

<sup>v</sup>Tested in dextrose 5% in sodium chloride 0.45%.

---

### **Additional Compatibility Information**

*Peritoneal Dialysis Solutions* — The activity of gentamicin 10 mg/L was evaluated in peritoneal dialysis fluids containing 1.5 or 4.25% dextrose (Dianeal 137, Travenol). Storage at 25 °C resulted in no loss of antimicrobial activity in 24 hours.<sup>(515)</sup>

Gentamicin sulfate (Schering) 3 and 10 mg/L in peritoneal dialysis concentrate with 50% dextrose retained about 90% of initial activity in seven hours and about 50 to 70% in 24 hours at room temperature.<sup>(1044)</sup>

The stability of gentamicin sulfate 8 mg/L, alone and with cefazolin sodium 75 and 150 mg/L, was evaluated in a peritoneal dialysis solution of dextrose 1.5% with heparin sodium 1000 units/L. Gentamicin activity was retained for 48 hours at both 4 and 26 °C, alone and with both concentrations of cefazolin. Cefazolin activity was also retained over the study period. At 37 °C, gentamicin losses ranged from 4 to 8% and cefazolin losses ranged from 10 to 12% in 48 hours.<sup>(1029)</sup>

In another study, the stability of gentamicin sulfate (Schering) was evaluated in peritoneal dialysate concentrates containing dextrose 30 and 50% (Dianeal) as well as in a diluted solution containing dextrose 2.5%. The gentamicin sulfate concentrations were 100 and 160 mg/L in the peritoneal dialysate concentrates and 5 and 8 mg/L in the diluted solutions. Gentamicin sulfate was found to be stable in all of these solutions for at least 24 hours at 23 °C.<sup>(1229)</sup>

Gentamicin 4 mcg/mL was evaluated in Dianeal PDS with dextrose 1.5 and 4.25% (Travenol) with cefazolin 125 mcg/mL, heparin 500 units, and albumin human 80 mg in 2-L bags. The gentamicin content was retained for 72 hours.<sup>(1413)</sup>

The retention of antimicrobial activity of gentamicin sulfate (SoloPak) 120 mg/L alone and with vancomycin hydrochloride (Lilly) 1 g/L was evaluated in Dianeal PD-2 (Travenol) with dextrose 1.5%. Little or no loss of either antibiotic occurred in eight hours at 37 °C. Gentamicin sulfate alone retained activity for at least 48 hours at 4 and 25 °C. In combination with vancomycin hydrochloride, antimicrobial activity of both antibiotics was retained for up to 48 hours. However, the authors recommended refrigeration at 4 °C for storage periods greater than 24 hours.<sup>(1414)</sup>

Gentamicin sulfate (Schering) 25 mcg/mL combined separately with the cephalosporins cefazolin sodium (Lilly) and ceftiofur (MSD) at a concentration of 125 mcg/mL in peritoneal dialysis solution (Dianeal 1.5%) exhibited enhanced rates of lethality to *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* compared to any of the drugs alone.<sup>(1623)</sup>

Gentamicin sulfate (American Pharmaceutical Partners) 8 mcg/mL in Delflex peritoneal dialysis solution bags with 2.5% dextrose (Fresenius) is stable with little or no loss occurring in 14 days refrigerated and at room temperature. <sup>(2573)</sup>

Gentamicin sulfate (American Pharmaceutical Partners) 8 mcg/mL with vancomycin hydrochloride (Lederle) 25 mcg/mL in Delflex peritoneal dialysis solution bags with 2.5% dextrose (Fresenius) is stable with little or no loss of either drug occurring in 14 days refrigerated and at room temperature. <sup>(2573)</sup>

*β-Lactam Antibiotics* — In common with other aminoglycoside antibiotics, gentamicin activity may be impaired by β-lactam antibiotics. The inactivation is dependent on concentration, temperature, and time of exposure. <sup>(68) (219) (504) (574) (575) (654) (667) (740) (792) (816) (824) (973) (1052) (1382)</sup>

The clinical significance of these interactions in patients appears to be primarily confined to those with renal failure. <sup>(218) (334) (361) (364) (616) (737) (816) (847)</sup> Literature reports of greatly reduced aminoglycoside levels in such patients have appeared frequently. <sup>(363) (365) (366) (367) (614) (666) (962)</sup> In addition, the interaction may be clinically important if assays for aminoglycoside levels in serum are sufficiently delayed. <sup>(576) (618) (735) (832) (847) (1052) (1382)</sup>

Most authors believe that in vitro mixing of penicillins with aminoglycoside antibiotics should be avoided but that clinical use of the drugs in combination can be of great value. It is generally recommended that the drugs be given separately in such combined therapy. <sup>(157) (218) (222) (224) (361) (364) (368) (369) (370)</sup>

*Local Anesthetics* — Gentamicin sulfate 80 mg (2 mL) was physically compatible with 1 mL of each of the following local anesthetics and did not show significant loss in 24 hours at room temperature or under refrigeration <sup>(227)</sup> :

Lidocaine hydrochloride 1 and 2% (Astra)

Lidocaine hydrochloride 1 and 2% with epinephrine 1:100,000 (Astra)

Mepivacaine hydrochloride 1 and 2% (Winthrop)

*Heparin* — Addition of gentamicin sulfate (Roussel) 80 mg to the tubing of an infusion solution of sodium chloride 0.9% containing heparin resulted in immediate precipitation. <sup>(528)</sup>

Gentamicin sulfate 10 mg/L with heparin sodium 1000 units/L in Dianeal with dextrose 5% peritoneal dialysis solution was reported to be conditionally compatible. No significant reduction in gentamicin sulfate concentration occurred in four to six hours. <sup>(228)</sup> However, a marked reduction in the anticoagulant activity of heparin sodium occurred if opalescence or a precipitate formed (which results if the undiluted drugs are combined), even if the precipitate redissolved. Heparin activity was retained if one drug was added to a dilute solution of the other and no precipitate formed. <sup>(295)</sup>

The incompatibility of heparin sodium with gentamicin sulfate is said to result from coprecipitation. <sup>(230)</sup>

A white precipitate may result from the administration of gentamicin sulfate through a heparinized intravenous cannula. <sup>(976)</sup> Flushing heparin locks with sodium chloride 0.9% before and after administering drugs incompatible with heparin has been recommended. <sup>(4)</sup>

*Sodium Citrate* — The physical stability of gentamicin sulfate (Schering) 1, 2, and 5 mg/mL in sodium citrate 4% anticoagulant solution (Baxter) was evaluated. The combination has been used in preventing hemodialysis catheter-related infections. The gentamicin dilutions were packaged in 3-mL syringes and were stored at 4 and 23 °C. The solutions remained clear and colorless for 35 days at both temperatures. The pH was found to be near 5.1 initially and did not change throughout the

study. Although the gentamicin content was not measured, the authors pointed out that other studies had reported that the drug in solutions within the pH range of 4 to 7 was stable for up to 90 days. Furthermore, in another study, sodium citrate had also been documented to be stable for 28 days at room temperature.<sup>(2631)</sup>

Gentamicin sulfate (Sandoz) 2.5 mg/mL in sodium citrate 4% (Cytasol) was found to be physically and chemically stable for 112 days at 24 °C packaged in polyethylene plastic syringes sealed with tip caps.<sup>(2824)</sup>

Gentamicin Sulfate - AHFS 8:12.02

## Glycopyrrolate - AHFS 12:08.08

**Products** — Glycopyrrolate is available in 1- and 2-mL single-dose vials and 5- and 20-mL multiple-dose vials. Each milliliter contains glycopyrrolate 0.2 mg, sodium hydroxide and/or hydrochloric acid to adjust the pH, and benzyl alcohol 0.9% in water for injection. [\(1-8/06\)](#)

*pH* — From 2 to 3. [\(1-8/06\)](#)

*Trade Name(s)* — Robinul

**Administration** — Glycopyrrolate may be administered by intravenous or intramuscular injection without dilution. The drug may also be given via the tubing of a running intravenous infusion. [\(1-8/06\)](#) [\(4\)](#)

**Stability** — Glycopyrrolate is a clear, colorless solution; intact vials should be stored at controlled room temperature. [\(1-8/06\)](#)

*pH Effects* — The stability of glycopyrrolate in solution is pH dependent. At pH 2 to 3, the drug is very stable. Above pH 6, the stability becomes questionable because of ester hydrolysis. The speed of this hydrolysis is increased with increasing pH. A significant decline in glycopyrrolate stability as the pH is increased above 6 can be seen in Table 1. [\(331\)](#)

**Table 1. Stability of Glycopyrrolate 0.8 mg/L in Dextrose 5% Adjusted to Various pH Values (25 °C)**

Admixture pH	Approximate Time for 5% Decomposition (hr)
4.0	>48
5.0	>48
6.0	30
6.5	7
7.0	4
8.0	2

Glycopyrrolate 0.8 mg/L in Ringer's injection, lactated, is physically compatible for 48 hours at 25 °C. The pH of the solution (6.1) is slightly higher than the pH range yielding acceptable glycopyrrolate stability (2 to 6). However, the drug can be administered via the tubing of a running intravenous infusion of Ringer's injection, lactated. [\(1-8/06\)](#) [\(4\)](#)

Because of the low pH of glycopyrrolate, mixtures with alkaline drugs such as barbiturates result in precipitation of the free acid. If the pH of the admixture is increased above 6 by an alkaline additive or solution, rapid ester hydrolysis of the glycopyrrolate results. [\(331\)](#)

*Syringes* — Glycopyrrolate (American Regent) 0.1 mg/mL in sodium chloride 0.9% in polypropylene syringes (Sherwood) was physically stable and exhibited little loss in 24 hours stored at 4 and 23 °C. [\(2199\)](#)

Glycopyrrolate (Robins) 0.2 mg/mL packaged as 4 mL of undiluted injection in 6-mL polypropylene syringes (Becton Dickinson) was stored at 4 and 25 °C exposed to fluorescent light. The injection remained visually clear, and little loss of glycopyrrolate occurred in 90 days at both storage conditions. [\(2439\)](#)

## Granisetron Hydrochloride - AHFS 56:22.20

**Products** — Granisetron hydrochloride is available in 1-mL single-use and 4-mL multiple-use vials containing in each milliliter the equivalent of granisetron 1 mg, sodium chloride 0.9%, citric acid 2 mg, and benzyl alcohol 10 mg as a preservative. <sup>(1-2/08)</sup>

Granisetron hydrochloride is also available in 1-mL single-use vials containing the equivalent of granisetron 0.1 mg, sodium chloride 9 mg, and citric acid 2 mg. <sup>(1-2/08)</sup>

*pH* — From 4.0 to 6.0. <sup>(1-2/08)</sup>

*Equivalency* — Granisetron hydrochloride 1.12 mg provides 1 mg of granisetron. <sup>(1-2/08)</sup>

**Administration** — Granisetron hydrochloride may be administered intravenously undiluted over 30 seconds or by intravenous infusion over five minutes after dilution to 20 to 50 mL with dextrose 5% or sodium chloride 0.9%. <sup>(1-2/08)</sup> (4)

**Stability** — Granisetron hydrochloride is a clear, colorless injection. Intact vials should be stored at controlled room temperature and protected from freezing and light. The drug is stable for at least 24 hours when diluted as directed in dextrose 5% or sodium chloride 0.9% and stored at room temperature under normal lighting conditions. <sup>(1-2/08)</sup>

*Syringes* — Granisetron hydrochloride (SmithKline Beecham) 0.05, 0.07, and 0.1 mg/mL (as granisetron) in sodium chloride 0.9% and in dextrose 5% was repackaged in polypropylene syringes (Sherwood Medical) (closure used not cited). Little or no granisetron hydrochloride loss occurred after 14 days at 5 and 24 °C. <sup>(1968)</sup>

Granisetron hydrochloride (SmithKline Beecham) 1 mg/mL was repackaged into Plastipak (Becton Dickinson) polypropylene syringes and stored at room temperature exposed to or protected from light and refrigerated at 4 °C. Little granisetron hydrochloride loss occurred in 15 days under any of these storage conditions. <sup>(2149)</sup>

*Central Venous Catheter* — Granisetron hydrochloride (SmithKline Beecham) 10 mcg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

### Compatibility Information

#### Solution Compatibility

##### Granisetron HCl

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.45%	BA <sup>b</sup>	SKB	20 mg	Physically compatible. Little loss in 24 hr at 20 °C under fluorescent light	1883	C
Dextrose 5% in sodium chloride 0.9%	BA <sup>b</sup>	SKB	20 mg	Physically compatible. Little loss in 24 hr at 20 °C under fluorescent light	1883	C
Dextrose 5%	BA <sup>b</sup>	SKB	20 mg	Physically compatible. Little loss in 24 hr at 20 °C under fluorescent light	1883	C
Dextrose 5%	BA <sup>a</sup>	SKB	200 mg	Physically compatible. Little loss in 24 hr at 20 °C under fluorescent light	1883	C

Dextrose 5%	BE	56 <sup>b</sup> and 150 <sup>a</sup> mg	Visually compatible. Little loss in 30 days at -20 °C then 7 days at 4 °C then 3 days at 20 °C	<a href="#">1884</a>	C
Dextrose 5%	MG <sup>c</sup>	SKB 20 mg	5% or less loss in 14 days at 4 °C	<a href="#">1837</a>	C
Sodium chloride 0.9%	BA <sup>b</sup>	SKB 20 mg	Physically compatible. Little loss in 24 hr at 20 °C under fluorescent light	<a href="#">1883</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	SKB 200 mg	Physically compatible. Little loss in 24 hr at 20 °C under fluorescent light	<a href="#">1883</a>	C
Sodium chloride 0.9%	BE	56 <sup>b</sup> and 150 <sup>a</sup> mg	Visually compatible. Little loss in 30 days at -20 °C then 7 days at 4 °C then 3 days at 20 °C	<a href="#">1884</a>	C
Sodium chloride 0.9%	MG <sup>c</sup>	SKB 20 mg	5% or less drug loss in 7 days at 4 °C, but 13% loss in 14 days	<a href="#">1837</a>	C

<sup>a</sup>Tested in polypropylene syringes.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Tested in Homepump (Block Medical) elastomeric reservoir pumps.

### Additive Compatibility

#### Granisetron HCl

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Dexamethasone sodium phosphate	AMR	92 mg	SKB	10 and 40 mg	D5W, NS <sup>a</sup>	Visually compatible. Little loss of either drug in 14 days at 4 and 24 °C in dark	<a href="#">1875</a>	C
Dexamethasone sodium phosphate	AMR	660 mg	SKB	10 and 40 mg	D5W, NS <sup>a</sup>	Visually compatible. Little dexamethasone and 8% granisetron loss in 14 days at 4 and 24 °C in dark	<a href="#">1875</a>	C
Dexamethasone sodium phosphate	MSD	75 and 345 mg	BE	55 and 51 mg	D5W, NS <sup>a</sup>	Visually compatible. Little loss of either drug in 72 hr at room temperature	<a href="#">1884</a>	C
Methylprednisolone sodium succinate	DAK	2.26 g	BE	56 mg	D5W, NS <sup>a</sup>	Visually compatible. Little loss of either drug in 72 hr at room temperature	<a href="#">1884</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in Ringer's injection, lactated.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Granisetron HCl tested in both sodium chloride 0.9% and dextrose 5%.

<sup>f</sup>Lyophilized formulation tested.

<sup>g</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>i</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>j</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>k</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

Granisetron Hydrochloride - AHFS 56:22.20

## Haloperidol Lactate - AHFS 28:16.08.08

**Products** — Haloperidol lactate is available in 1-mL ampuls and vials and 10-mL multiple-dose vials. Each milliliter of solution contains haloperidol 5 mg (as the lactate) and lactic acid for pH adjustment. <sup>(1-2/08)</sup>

*pH* — From 3 to 3.6 <sup>(1-2/08)</sup> or 3.8. <sup>(17)</sup>

*Trade Name(s)* — Haldol

**Administration** — Haloperidol lactate should be administered intramuscularly <sup>(1-2/08)</sup> (4), although intravenous administration has been performed. <sup>(4)</sup> (571) (1258)

**Stability** — Haloperidol lactate should be stored at controlled room temperature and protected from light; freezing and temperatures above 40 °C should be avoided. <sup>(1-2/08)</sup> (4)

*Central Venous Catheter* — Haloperidol lactate (McNeil) 0.2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

### Compatibility Information

#### Solution Compatibility

##### Haloperidol lactate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.225%	AB	MN	0.1 to 1 g	Visually compatible for 7 days at 21 °C	1740	C
Dextrose 5% in sodium chloride 0.225%	AB	MN	2 and 3 g	Precipitate forms in 30 to 60 min	1740	I
Dextrose 5%	TR <sup>a</sup>	MN	100 mg	Physically compatible and stable for 38 days at 24 °C	571	C
Dextrose 5%	AB	MN	0.1 to 3 g	Visually compatible for 7 days at 21 °C	1740	C
Ringer's injection, lactated	AB	MN	0.1 to 1 g	Visually compatible for 7 days at 21 °C	1740	C
Ringer's injection, lactated	AB	MN	2 g	Precipitate forms within 15 min	1740	I
Ringer's injection, lactated	AB	MN	3 g	Precipitate forms immediately	1740	I
Sodium chloride 0.45%	AB	MN	0.1 to 1 g	Visually compatible for 7 days at 21 °C	1740	C
Sodium chloride 0.45%	AB	MN	2 g	Precipitate forms within 15 min	1740	I
Sodium chloride 0.45%	AB	MN	3 g	Precipitate forms immediately	1740	I
Sodium chloride 0.9%	AB <sup>b</sup>	MN	2 and 3 g	Slight precipitate forms immediately and becomes much heavier within 15 to 30 min	1523	I
Sodium chloride 0.9%	AB <sup>b</sup>	MN	1 g	Slight precipitate forms immediately and persists through 8 hr	1523	I

Sodium chloride 0.9%	AB <sup>b</sup>	MN	100 and 500 mg	Visually compatible for 8 hr at 21 °C under fluorescent light	<a href="#">1523</a>	C
Sodium chloride 0.9%	AB	MN	0.1 to 0.75 g	Visually compatible for 7 days at 21 °C	<a href="#">1740</a>	C
Sodium chloride 0.9%	AB	MN	1 to 3 g	Precipitate forms immediately	<a href="#">1740</a>	I

<sup>a</sup>Tested in both glass and PVC containers.

<sup>b</sup>Tested in glass containers.

### Additive Compatibility

#### Haloperidol lactate

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Buprenorphine HCl with glycopyrrolate	RKC	84 mg 25 mg	ON	104 mg	NS <sup>a</sup>	Visually compatible with less than 10% loss of any drug in 30 days at 4 and 25 °C in the dark	<a href="#">2436</a>	C
Glycopyrrolate with buprenorphine HCl	RKC	25 mg 84 mg	ON	104 mg	NS <sup>a</sup>	Visually compatible with less than 10% loss of any drug in 30 days at 4 and 25 °C in the dark	<a href="#">2436</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>d</sup>Injected over one minute.

<sup>e</sup>Tested in both dextrose 5% and sodium chloride 0.9%. Run at 1000 units/hr.

<sup>f</sup>Tested in Ringer's injection, lactated.

<sup>g</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>i</sup>Lyophilized formulation tested.

<sup>j</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>k</sup>Quinupristin and dalfopristin components combined.

Haloperidol Lactate - AHFS 28:16.08.08

## Heparin Sodium - AHFS 20:12.04.16

**Products** — Heparin sodium is available from various manufacturers in concentrations ranging from 1000 to 20,000 units/mL, packaged in sizes ranging from 0.5- to 1-mL ampuls, vials, or prefilled syringes to 30-mL multiple-dose vials. Benzyl alcohol or parabens may also be present as preservatives, and hydrochloric acid and/or sodium hydroxide may have been added to adjust pH. Sodium chloride may have been added to some products for isotonicity. In addition, dilute solutions of 10 and 100 units/mL in 1- to 5-mL disposable syringes and 1- to 30-mL vials are available for use in flushing heparin locks.<sup>(4)</sup>

Heparin sodium is also available premixed in various concentrations in sodium chloride 0.45 and 0.9% and dextrose 5%.<sup>(4)</sup>

*pH* — Heparin sodium injection and heparin lock flush solution are adjusted to pH 5 to 7.5 during manufacturing.<sup>(1-3/09)</sup> <sup>(17)</sup>

*Osmolality* — The osmolality of heparin sodium (Elkins-Sinn) 1000 units/mL was determined to be 384 mOsm/kg by freezing-point depression and 283 mOsm/kg by vapor pressure.<sup>(1071)</sup>

One heparin lock flush solution is reported to have an osmolarity of 392 mOsm/L.<sup>(4)</sup>

Commercial heparin sodium infusion solutions in sodium chloride 0.9% and dextrose 5% have osmolalities of 322 and 270 mOsm/kg, respectively.<sup>(4)</sup>

**Administration** — Heparin sodium may be administered by deep subcutaneous injection, by intermittent intravenous injection undiluted or diluted in 50 to 100 mL of dextrose 5% or sodium chloride 0.9%, or by continuous intravenous infusion in a liter of compatible solution, preferably using an electronic rate-control device. The container should be inverted at least six times after heparin sodium addition to prevent pooling of the heparin. Intramuscular injection should not be used because of pain and hematoma formation.<sup>(4)</sup>

Care is required when adding heparin sodium to infusion solutions, especially in flexible containers. When heparin sodium was added to a flexible PVC container of sodium chloride 0.9% hanging in the use position, pooling of the heparin resulted; 97% of the heparin was delivered in the first 30% of the solution. Repeated inversion and agitation of the containers to effect thorough mixing eliminates this pooling (and the danger of overdosage), yielding an even distribution and a constant delivery concentration.<sup>(85)</sup>

**Stability** — Heparin sodium solutions are colorless to slightly yellow.<sup>(4)</sup> Heparin sodium solution should not be used if it is discolored or contains a precipitate. Heparin sodium should be stored at controlled room temperature<sup>(1-3/09)</sup> <sup>(4)</sup> and protected from freezing and temperatures exceeding 40 °C.<sup>(4)</sup> <sup>(21)</sup> In a study of hospital-manufactured heparin sodium 1 unit/mL in sodium chloride 0.9%, full anticoagulant activity was retained for at least 12 months after sterilization by autoclaving and subsequent storage at room temperature exposed to daylight.<sup>(675)</sup>

*pH Effects* — A pH profile of heparin sodium 20,000 units/L in dextrose 5% over a pH range of 3.8 to 7.6 did not reveal a loss during the 24-hour study.<sup>(21)</sup> In another report, heparin sodium in sodium chloride 0.9% was tested at pH 3.2 (adjusted with hydrochloric acid) and 9.2 (adjusted with sodium hydroxide). No loss was noted in 24 hours.<sup>(57)</sup> However, a pH profile of heparin sodium 660 units/mL, when autoclaved for 10 minutes at 10 pounds/inch<sup>2</sup> at 115 °C, showed loss of activity at pH values above 8.5 and especially below 5.<sup>(243)</sup>

*Syringes* — The stability of 50 mL of a 500-unit/mL heparin sodium solution in sodium chloride 0.9% packaged in 50-mL polypropylene syringes was studied. Storage both at room temperature and at 0

to 4 °C showed an overall trend to lower activity by about 8% after three weeks.

When glass containers were compared to plastic syringes, the glass containers consistently showed lower retained activity in as little as two hours after preparation. The possibility of adsorption to glass surfaces was noted<sup>(676)</sup> but has not been demonstrated.

Heparin sodium 1 unit/mL, prefilled into Injekt (Braun) all-plastic syringes having polyethylene barrels and polypropylene plungers, showed no significant activity loss over 52 weeks at 37 °C due to decomposition or sorption. However, plastic syringes with rubber-tipped plungers, such as Plastipak (Becton Dickinson) and Perfusor (Braun), exhibited extra ultraviolet peaks, presumably due to leaching of rubber components.<sup>(1491)</sup>

Heparin sodium (Leo) 300 units/mL in dextrose 5% or water for injection was drawn into 50-mL polypropylene syringes (Plastipak, Becton Dickinson) and stored for eight hours at room temperature and 4 °C. No loss in either solvent occurred.<sup>(1799)</sup>

The stability of heparin sodium repackaged in 10-mL polypropylene syringes for use in CADD-Micro syringe pumps was evaluated. Ten milliliters of heparin sodium 1000 units/mL (Elkins-Sinn) and 40,000 units/mL (Schein) were packaged in the test syringes and capped. Syringes were stored at a near-body temperature of 30 °C for 30 days. Little or no loss of heparin sodium content occurred; actual activity in prolonging blood clotting was not evaluated.<sup>(2275)</sup>

*Sorption* — Heparin sodium, BP, 2000 units/2 mL was stored for 18 hours at room temperature in plastic syringes: Brunswick (Sherwood Medical), Plastipak (Becton Dickinson), Steriseal (Needle Industries), and Sabre (Gillette U.K.). The first three syringes have polypropylene barrels; the Sabre has a combination polypropylene-polystyrene barrel. No significant loss of heparin occurred due to sorption.<sup>(784)</sup>

Heparin sodium (Leo) 300 units/mL in dextrose 5% or water for injection was delivered at 4 mL/hr by syringe pump through PVC and polyethylene-lined PVC infusion tubing for 12 hours at room temperature. No loss occurred due to sorption to the polyethylene-lined tubing. However, losses of about 15 to 25% occurred with the PVC tubing and were especially high during the first 15 minutes of infusion.<sup>(1799)</sup>

*Filtration* — Heparin sodium (Abbott) 10,000 units/L in dextrose 5% and sodium chloride 0.9% was filtered at 120 mL/hr for six hours through a 0.22-µm cellulose ester membrane filter (Ivex-2). No significant loss due to binding to the filter was noted.<sup>(533)</sup>

*Central Venous Catheter* — Heparin sodium (Elkins-Sinn) 100 units/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Heparin sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Amino acids 4.25%, dextrose 25%	MG	RI	20,000 units	No increase in particulate matter in 24 hr at 5 °C	349	C
Dextrose 2.5% in half-strength Ringer's injection	AB	AB	1000 and 4000 units	Physically compatible	3	C

Sodium lactate (1/6) M		OR	20,000 units	50% loss within 1 hr at 23 °C	<a href="#">113</a>	I
TPN #48 to #51 <sup>c</sup>		AH	35,000 units	Heparin activity retained for 24 hr at 25 °C but significantly decreased after 24 hr	<a href="#">900</a>	C
TPN #205 <sup>c</sup>		LY	3000 to 20,000 units	Heparin activity retained for 28 days at 4 °C	<a href="#">2025</a>	C

<sup>a</sup>Tested in both glass and PVC containers.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>d</sup>Tested in polyethylene and glass containers.

### Additive Compatibility

#### Heparin sodium

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Alteplase	GEN	0.5 g	ES	40,000 units	NS	Heparin interacts with alteplase. Opalescence forms within 5 min with peak intensity at 4 hr at 25 °C. Alteplase clot-lysis activity reduced slightly	<a href="#">1856</a>	I
Amikacin sulfate	BR	5 g	AB	30,000 units	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Precipitates immediately	<a href="#">294</a>	I
Aminophylline		250 mg		12,000 units	D5W	Physically compatible	<a href="#">74</a>	C
Aminophylline	SE	1 g	UP	4000 units	D5W	Physically compatible	<a href="#">15</a>	C
Amphotericin B	SQ	100 mg	AB	4000 units	D	Physically compatible	<a href="#">21</a>	C

Dobutamine HCl	LI	900 mg	LY	50,000 units	D5W, W	Physically compatible for 4 hr, but heat of reaction detected by microcalorimetry	<a href="#">1318</a>	I
Dobutamine HCl	LI	900 mg	LY	50,000 units	NS	Physically compatible for 4 hr with no heat of reaction detected by microcalorimetry	<a href="#">1318</a>	C
Dopamine HCl	AS	800 mg	AB	200,000 units	D5W	No dopamine or heparin loss in 24 hr at 25 °C	<a href="#">312</a>	C
Enalaprilat	MSD	12 mg	ES	50,000 units	D5W <sup>a</sup>	Visually compatible. Little enalaprilat loss in 24 hr at room temperature under fluorescent light. Heparin not tested	<a href="#">1572</a>	C

Epirubicin HCl						Potential precipitation	<a href="#">1(3/09)</a>	I
Erythromycin lactobionate	AB	1 g	AB	1500 units		Precipitate forms within 1 hr	<a href="#">20</a>	I
Erythromycin lactobionate	AB	5 g	UP	4000 units	D5W	Physically incompatible	<a href="#">15</a>	I
Erythromycin lactobionate	AB	1.5 g	OR	20,000 units	D5W, NS	Precipitate forms	<a href="#">113</a>	I
Erythromycin lactobionate	AB	1 g	AB	20,000 units		Precipitate forms within 1 hr	<a href="#">21</a>	I
Esmolol HCl	DU	6 g	LY	50,000 units	D5W	Physically compatible with no esmolol loss in 24 hr at room temperature under fluorescent light. Heparin not tested	<a href="#">1358</a>	C
Floxacillin sodium	BE	20 g	WED	20,000 units	NS	Physically compatible for 24 hr at 15 and 30 °C. Haze forms in 48 hr at 30 °C. No change at 15 °C	<a href="#">1479</a>	C
Fluconazole	PF	1 g	BA	50,000 units	D5W	Fluconazole stable for 24 hr at 25 °C in fluorescent light. Heparin not tested	<a href="#">1676</a>	C
Flumazenil	RC	20 mg	ES	50,000 units	D5W <sup>a</sup>	Visually compatible. 4% flumazenil loss in 24 hr at 23 °C in fluorescent light. Heparin not tested	<a href="#">1710</a>	C
Furosemide	HO	1 g	WED	20,000 units	NS	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Gentamicin sulfate		320 mg	BP	20,000 units	D5W, NS	Precipitates immediately	<a href="#">26</a>	I
Gentamicin sulfate	SC	1 g	OR	20,000 units	D5W, NS	Opalescence	<a href="#">113</a>	I
Gentamicin sulfate	ME	88 mg	BRN	1000 to 6000 units	D10W, NS	Activity of both drugs greatly reduced	<a href="#">1570</a>	I
Hydrocortisone sodium succinate		800 mg		32,000 units	NS	Physically compatible and heparin activity retained for 24 hr	<a href="#">57</a>	C
Hydrocortisone sodium succinate	UP	500 mg	UP	4000 units	D5W	Physically incompatible	<a href="#">15</a>	I
Hydrocortisone sodium succinate	UP	100 mg		12,000 units	D5W	Precipitates immediately	<a href="#">74</a>	I

Hydromorphone HCl	KN	20 g	OR	1000 units	D5W <sup>a</sup>	Visually compatible with no loss of hydromorphone in 18 days at 4 and 23 °C. Heparin not tested	<a href="#">2410</a>	C
Hydromorphone HCl	KN	5 g	OR	500 units	D5W <sup>a</sup>	Visually compatible with no loss of hydromorphone in 18 days at 4 and 23 °C. Heparin not tested	<a href="#">2410</a>	C
Hydromorphone HCl	KN	5 g	OR	8000 units	D5W <sup>a</sup>	Visually compatible with no loss of hydromorphone in 18 days at 4 and 23 °C. Heparin not tested	<a href="#">2410</a>	C
Isoproterenol HCl		2 mg		32,000 units	NS	Physically compatible and heparin activity retained for 24 hr	<a href="#">57</a>	C
Isoproterenol HCl	WI	4 mg	AB	20,000 units		Physically compatible	<a href="#">59</a>	C
Lidocaine HCl		4 g		32,000 units	NS	Physically compatible and heparin activity retained for 24 hr	<a href="#">57</a>	C
Lidocaine HCl	AST	2 g	AB	20,000 units		Physically compatible	<a href="#">24</a>	C
Lincomycin HCl	UP	600 mg	AB	20,000 units		Physically compatible	<a href="#">21</a>	C
Magnesium sulfate		130 mEq		50,000 units	NS <sup>b</sup>	Visually compatible with heparin activity retained for 14 days at 24 °C under fluorescent light	<a href="#">1908</a>	C
Meropenem	ZEN	1 and 20 g	ES	20,000 units	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C
Methyldopate HCl	MSD	1 g	AB	20,000 units	D, D-S, S	Physically compatible	<a href="#">23</a>	C
Methylprednisolone sodium succinate	UP	40 mg		10,000 units	D5S	Clear solution for 24 hr	<a href="#">329</a>	C
Methylprednisolone sodium succinate	UP	125 mg		5000 units	D5S, D5W, LR, R	Clear solution for 24 hr	<a href="#">329</a>	C
Methylprednisolone sodium succinate	UP	25 g		40,000 units	NS	Clear solution for 24 hr	<a href="#">329</a>	C

Mitomycin	BR	167 mg	ES	33,300 units	NS <sup>b</sup>	Visually compatible. 10% mitomycin calculated loss in 21 hr and no decrease in heparin bioactivity at 25 °C	<a href="#">1866</a>	I
Mitomycin	BR	167 mg	ES	33,300 units	NS <sup>a</sup>	Visually compatible. 10% mitomycin calculated loss in 25 hr and no decrease in heparin bioactivity at 25 °C	<a href="#">1866</a>	C
Mitomycin	BR	500 mg	ES	33,300 units	NS <sup>b</sup>	Visually compatible. 10% mitomycin calculated loss in 42 hr and no decrease in heparin bioactivity at 25 °C	<a href="#">1866</a>	C
Mitomycin	BR	500 mg	ES	33,300 units	NS <sup>a</sup>	Visually compatible. 10% mitomycin calculated loss in 61 hr and no decrease in heparin bioactivity at 25 °C	<a href="#">1866</a>	C
Nafcillin sodium	WY	500 mg	AB, WY	20,000 units		Physically compatible	<a href="#">27</a>	C
Nafcillin sodium	WY	500 mg	AB	20,000 units		Physically compatible	<a href="#">21</a>	C
Norepinephrine bitartrate	WI	8 mg		12,000 units	D5W	Physically compatible	<a href="#">74</a>	C
Norepinephrine bitartrate	WI	8 mg	AB	20,000 units	D, D-S, S	Physically compatible	<a href="#">77</a>	C
Octreotide acetate	SZ	1.5 mg	ES	1000 units	TPN #120 <sup>c</sup>	Little octreotide loss over 48 hr at room temperature in ambient light	<a href="#">1373</a>	C
Penicillin G potassium		1 million units		12,000 units	D5W	Physically compatible	<a href="#">74</a>	C
Penicillin G potassium	SQ	1 million units	AB	20,000 units	D5W	Penicillin stable for 24 hr at 25 °C	<a href="#">47</a>	C
Penicillin G potassium	SQ	20 million units	UP	4000 units	D5W	Physically incompatible	<a href="#">15</a>	I

Penicillin G sodium	BE	20 million units	OR	20,000 units	NS	Both stable for 24 hr at 25 °C	<a href="#">113</a>	C
Penicillin G sodium	UP	20 million units	UP	4000 units	D5W	Physically incompatible	<a href="#">15</a>	I
Polymyxin B sulfate	BP	20 mg	BP	20,000 units	D5W	Precipitates immediately	<a href="#">26</a>	I
Polymyxin B sulfate	BP	20 mg	BP	20,000 units	NS	Haze develops over 3 hr	<a href="#">26</a>	I
Potassium chloride		3 g		12,000 units	D5W	Physically compatible	<a href="#">74</a>	C
Potassium chloride	AB	40 mEq	AB	20,000 units		Physically compatible	<a href="#">21</a>	C
Potassium chloride		80 mEq		32,000 units	NS	Physically compatible and heparin activity retained for 24 hr	<a href="#">57</a>	C
Promethazine HCl	WY	250 mg	UP	4000 units	D5W	Physically incompatible	<a href="#">15</a>	I
Ranitidine HCl	GL	2 g	ES	10,000 and 40,000 units	D5W, NS <sup>a</sup>	Physically compatible. 2% ranitidine loss in 48 hr at room temperature in light. Heparin not tested	<a href="#">1361</a>	C
Ranitidine HCl	GL	50 mg	ES	10,000 and 40,000 units	NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature in light. Heparin not tested	<a href="#">1361</a>	C
Ranitidine HCl	GL	50 mg	ES	10,000 and 40,000 units	D5W <sup>a</sup>	Physically compatible. 7% ranitidine loss in 24 hr and 12% loss in 48 hr at room temperature in light. Heparin not tested	<a href="#">1361</a>	C
Sodium bicarbonate	AB	2.4 mEq <sup>e</sup>	AB	20,000 units	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Streptomycin sulfate		1 g	AB	20,000 units		Precipitate forms within 1 hr	<a href="#">21</a>	I
Streptomycin sulfate	BP	4 g	BP	20,000 units	D5W, NS	Precipitates immediately	<a href="#">26</a>	I
Teicoplanin	HO	2 g	CPP	20,000 and 40,000 units	D5W, NS	Visually compatible. No loss of teicoplanin and heparin in 24 hr at 25 °C	<a href="#">2165</a>	C
Vancomycin HCl	LI	1 g		12,000 units	D5W	Precipitates immediately	<a href="#">74</a>	I

Vancomycin HCl	LE	400 mg	IX	1000 units	TPN #95 <sup>c</sup>	Physically compatible and vancomycin stable for 8 days at room temperature and under refrigeration	<a href="#">1321</a>	C
Vancomycin HCl	LI	25 mg	ES	100,000 units	NS	Physically compatible. Under 10% vancomycin loss and no heparin loss in 30 days at 28 °C and 63 days at 4 °C	<a href="#">2542</a>	C
Verapamil HCl	KN	80 mg	ES	20,000 units	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in glass containers.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>d</sup>Hydrocortisone sodium succinate (Pharmacia Upjohn) 50 mg/L was also present.

<sup>e</sup>One vial of Neut added to a liter of admixture.

### Drugs in Syringe Compatibility

#### Heparin sodium

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Amikacin sulfate		100 mg		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Aminophylline		240 mg/10 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Amiodarone HCl	LZ	150 mg/3 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Amphotericin B		50 mg		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Ampicillin sodium		2 g		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Atropine sulfate		0.5 mg/1 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Bleomycin sulfate		1.5 units/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Buprenorphine HCl	BM	300 mg/1 mL		2500 units/1 mL	Visually compatible for at least 5 min	<a href="#">1053</a>	C
Caffeine citrate		20 mg/1 mL	AB	10 units/1 mL	Visually compatible for 4 hr at 25 °C	<a href="#">2440</a>	C
Cefazolin sodium		2 g		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C

Cefotaxime sodium	HO	2 g		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Cefotaxime sodium	WW	10 mg/mL	HOS	5000 units/mL	Physically compatible. No cefotaxime loss in 3 days at 4 °C. Losses of 7 and 14% in 1 and 2 days at 27 °C	<a href="#">2820</a>	C
Cefoxitin sodium	MSD	2 g		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Chloramphenicol sodium succinate	PD	1 g	AB	20,000 units/1 mL	Physically compatible for at least 30 min	<a href="#">21</a>	C
Chloramphenicol sodium succinate		1 g		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Chlorpromazine HCl		50 mg/2 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Cisplatin		0.5 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Clindamycin phosphate	UP	300 mg		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Clonazepam	RC	1 mg/2 mL		2500 units/1 mL	Visually compatible for at least 5 min	<a href="#">1053</a>	C
Clonidine HCl	BI	0.15 mg/1 mL		2500 units/1 mL	Visually compatible for at least 5 min	<a href="#">1053</a>	C
Cyclophosphamide		10 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Diazepam		10 mg/2 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Digoxin		0.25 mg/1 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Dimenhydrinate		65 mg/10 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Dimenhydrinate		10 mg/1 mL		25,000 units/1 mL	Precipitate forms	<a href="#">2569</a>	I
Dobutamine HCl	LI	250 mg/10 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Dopamine HCl		50 mg/5 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Doxorubicin HCl		1 mg/0.5 mL		500 units/0.5 mL	Precipitates immediately	<a href="#">980</a>	I
Droperidol		1.25 mg/0.5 mL		500 units/0.5 mL	Precipitates immediately	<a href="#">980</a>	I
Droperidol	JN	5 mg/2 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Epinephrine HCl		1 mg/1 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Erythromycin lactobionate	AB	1 g	AB	20,000 units/1 mL	Physically incompatible	<a href="#">21</a>	I
Etomidate	JN	20 mg/10 mL		2500 units/1 mL	Visually compatible for at least 5 min	<a href="#">1053</a>	C

Fentanyl citrate	JN	0.1 mg/2 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Floxacin sodium	BE	1 g		2500 units/1 mL	Visually compatible for at least 5 min	<a href="#">1053</a>	C
Fluorouracil		25 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Fluorouracil	DB	500 mg/20 mL	LEO	20,000 units/0.8 mL	Visually compatible with no loss of either drug in 7 days at 25 °C and 14 days at 4 °C in the dark	<a href="#">2415</a>	C
Furosemide		5 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Furosemide		20 mg/2 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Gentamicin sulfate		40 mg		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Haloperidol lactate	JN	5 mg/1 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Hydromorphone HCl	KN	50 mg/1 mL	OR	10 units/1 mL	White cloudy precipitate	<a href="#">2410</a>	I
Hydromorphone HCl	KN	50 mg/1 mL	LEO	100 units/1 mL	White cloudy precipitate	<a href="#">2410</a>	I
Hydromorphone HCl	KN	50 mg/1 mL	OR	25,000 units/1 mL	White cloudy precipitate	<a href="#">2410</a>	I
Iohexol	WI	64.7%, 5 mL	OR	5000 units/0.5 mL	Physically compatible for at least 2 hr	<a href="#">1438</a>	C
Iopamidol	SQ	61%, 5 mL	OR	5000 units/0.5 mL	Physically compatible for at least 2 hr	<a href="#">1438</a>	C
Iothalamate meglumine	MA	60%, 5 mL	OR	5000 units/0.5 mL	Physically compatible for at least 2 hr	<a href="#">1438</a>	C
Ioxaglate meglumine-ioxaglate sodium	MA	5 mL	OR	5000 units/0.5 mL	Physically compatible for at least 2 hr	<a href="#">1438</a>	C
Leucovorin calcium		5 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Lidocaine HCl	AST	100 mg/5 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Lincomycin HCl	UP	600 mg/2 mL	AB	20,000 units/1 mL	Physically compatible for at least 30 min	<a href="#">21</a>	C
Meperidine HCl	HO	100 mg/2 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Methotrexate sodium		12.5 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C

Methotrimeprazine HCl		25 mg/1 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Metoclopramide HCl		2.5 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Metoclopramide HCl		10 mg/2 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Metoclopramide HCl	RB	10 mg/2 mL	ES	2000 units/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Metoclopramide HCl	RB	10 mg/2 mL	ES	4000 units/4 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Metoclopramide HCl	RB	160 mg/32 mL	ES	16,000 units/16 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Mexiletine HCl	BI	250 mg/10 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Midazolam HCl	RC	15 mg/3 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Mitomycin		0.25 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Morphine sulfate		1, 2, 5, 10 mg	WY	100 and 200 units	Brought to 5 mL with NS. Physically compatible with no morphine loss in 24 hr at 23 °C	<a href="#">985</a>	C
Morphine sulfate		1, 2, 5 mg	WY	100 and 200 units	Brought to 5 mL with W. Physically compatible with no morphine loss in 24 hr at 23 °C	<a href="#">985</a>	C
Morphine sulfate		10 mg	WY	100 and 200 units	Brought to 5 mL with W. Immediate haze with precipitate and 5 to 7% morphine loss	<a href="#">985</a>	I
Nafcillin sodium	WY	500 mg	AB	20,000 units/1 mL	Physically compatible for at least 30 min	<a href="#">21</a>	C
Naloxone HCl	DU	0.4 mg/1 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Neostigmine methylsulfate	RC	0.5 mg/1 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Nitroglycerin		25 mg/25 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Pancuronium bromide		4 mg/2 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Pantoprazole sodium	c	4 mg/1 mL		25,000 units/1 mL	Precipitates within 1 hr	<a href="#">2574</a>	I
Pentazocine lactate	WI	30 mg/1 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Phenobarbital sodium		200 mg/1 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Promethazine HCl		50 mg/2 mL		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I

Ranitidine HCl	GL	50 mg/5 mL		2500 units/1 mL	Visually compatible for at least 5 min	<a href="#">1053</a>	C
Sodium nitroprusside		60 mg/5 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Streptomycin sulfate		1 g	AB	20,000 units/1 mL	Physically incompatible	<a href="#">21</a>	I
Succinylcholine chloride		100 mg/5 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Tobramycin sulfate		80 mg/2 mL		10 units/1 mL	Turbidity or fine white precipitate due to formation of an insoluble salt	<a href="#">845</a>	I
Tobramycin sulfate	LI	40 mg		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Tramadol HCl	GRU	100 mg/2 mL		2500 units/1 mL	Visually compatible for at least 5 min	<a href="#">1053</a>	C
Trimethoprim-sulfamethoxazole		80 mg/5 mL <sup>d</sup>		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Vancomycin HCl	LI	500 mg		2500 units/1 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Verapamil HCl	KN	5 mg/2 mL		2500 units/1 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Vinblastine sulfate		0.5 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Vinblastine sulfate	LI	1 mg/1 mL		200 units/1 mL <sup>a</sup>	Turbidity appears in 2 to 3 min	<a href="#">767</a>	I
Vincristine sulfate		0.5 mg/0.5 mL		500 units/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Warfarin sodium	DU	2 mg/1 mL <sup>b</sup>	ES	5000 units/1 mL	Low-level haze forms immediately and becomes visible in ambient light in 1 hr	<a href="#">2010</a>	I

<sup>a</sup>Tested in bacteriostatic sodium chloride 0.9%.

<sup>b</sup>Tested in sterile water for injection.

<sup>c</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

### ***Y-Site Injection Compatibility (1:1 Mixture)***

#### **Heparin sodium**

<b>Drug</b>	<b>Mfr</b>	<b>Conc</b>	<b>Mfr</b>	<b>Conc</b>	<b>Remarks</b>	<b>Ref</b>	<b>C/I</b>
Acetaminophen	CAD	10 mg/mL	HOS	100 units/mL	Physically compatible with less than 10%	<a href="#">2841</a> <a href="#">2844</a>	C

Acyclovir sodium	BW	5 mg/mL <sup>a</sup>	ES	50 units/mL <sup>a</sup>	acetaminophen loss over 4 hr at room temperature	<a href="#">1157</a>	C
Acyclovir sodium	BV	5 mg/mL <sup>b</sup>	BD	100 units/mL	Physically compatible for 4 hr at 25 °C	<a href="#">2794</a>	C
Aldesleukin	CHI	33,800 I.U./mL <sup>a</sup>	BA	100 units/mL	Physically compatible	<a href="#">1857</a>	C
Aldesleukin	CHI <sup>r</sup>	<sup>a</sup>			Visually compatible with little or no loss of aldesleukin activity	<a href="#">1890</a>	?
					Visually compatible but aldesleukin activity was variable depending on rate of delivery. Heparin not tested		
Allopurinol sodium	BW	3 mg/mL <sup>b</sup>	ES	100 units/mL <sup>b</sup>	Physically compatible for 4 hr at 22 °C	<a href="#">1686</a>	C
Alteplase	GEN	1 mg/mL	ES	100 units/mL <sup>a</sup>	Haze noted in 24 hr	<a href="#">1340</a>	I
Amifostine	USB	10 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">1845</a>	C
Aminophylline	SE	25 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C
Amiodarone HCl				300 units/mL <sup>b</sup>	White precipitate forms upon sequential administration	<a href="#">791</a>	I
Amphotericin B	SQ	0.1 mg/mL <sup>a</sup>	SO	100 units/mL <sup>b</sup>	Turbidity forms in 45 min	<a href="#">1435</a>	I
Amphotericin B cholesteryl sulfate complex	SEQ	0.83 mg/mL <sup>a</sup>	WY	1000 units/mL <sup>a</sup>	Gross precipitate forms	<a href="#">2117</a>	I
Ampicillin sodium	BR	25, 50, 100, 125 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C
Ampicillin sodium	WY	20 mg/mL <sup>b</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Ampicillin sodium	NOP	10 mg/mL <sup>b</sup>	LEO	10 and 5000 units/mL <sup>b</sup>	Physically compatible with little	<a href="#">2684</a>	C

change in heparin activity in 14 days at 4 and 37 °C. Antibiotic not tested

Ampicillin sodium-sulbactam sodium	PF	20 mg/mL <sup>bu</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Amsacrine	NCI	1 mg/mL <sup>a</sup>	SO	40 units/mL <sup>a</sup>	Orange precipitate forms immediately	<a href="#">1381</a>	I
Anidulafungin	VIC	0.5 mg/mL <sup>a</sup>	AB	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2617</a>	C
Antithymocyte globulin (rabbit)	SGS	0.2 mg/mL <sup>a</sup>	ES	2 units/mL <sup>a</sup>	Haze and precipitate form immediately	<a href="#">2488</a>	I
Antithymocyte globulin (rabbit)	SGS	0.3 mg/mL <sup>a</sup>	ES	2 units/mL <sup>a</sup>	Haze and precipitate form immediately	<a href="#">2488</a>	I
Antithymocyte globulin (rabbit)	SGS	0.2 mg/mL <sup>b</sup>	ES	2 units/mL <sup>b</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2488</a>	C
Antithymocyte globulin (rabbit)	SGS	0.3 mg/mL <sup>b</sup>	ES	2 units/mL <sup>b</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2488</a>	C
Antithymocyte globulin (rabbit)	SGS	0.2 mg/mL <sup>ab</sup>	ES	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2488</a>	C
Antithymocyte globulin (rabbit)	SGS	0.3 mg/mL <sup>ab</sup>	ES	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2488</a>	C
Atracurium besylate	BW	0.5 mg/mL <sup>a</sup>	SO	40 units/mL <sup>a</sup>	Physically compatible for 24 hr at 28 °C	<a href="#">1337</a>	C
Atropine sulfate	BW	0.5 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Aztreonam	SQ	40 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">1758</a>	C
Aztreonam	BV	20 mg/mL <sup>a</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Bivalirudin	TMC	5 mg/mL <sup>a</sup>	AB	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2373</a>	C
Bleomycin sulfate		3 units/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. No precipitate	<a href="#">980</a>	C

seen

Caffeine citrate		20 mg/mL		1 unit/mL <sup>a</sup>	Compatible and stable for 24 hr at room temperature	<a href="#">1(3/09)</a>	C
Calcium gluconate	ES	100 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C
Caspofungin acetate	ME	0.7 mg/mL <sup>b</sup>	HOS	100 units/mL	Immediate white turbid precipitate forms	<a href="#">2758</a>	I
Caspofungin acetate	ME	0.5 mg/mL <sup>b</sup>	BA	100 units/mL	Fine white crystalline material reported	<a href="#">2766</a>	I
Cefazolin sodium	SKB	20 mg/mL	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Cefazolin sodium	NOP	10 mg/mL <sup>b</sup>	LEO	10 and 5000 units/mL <sup>b</sup>	Physically compatible with little change in heparin activity in 14 days at 4 and 37 °C. Antibiotic not tested	<a href="#">2684</a>	C
Cefotetan disodium	STU	40 mg/mL <sup>a</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Ceftaroline fosamil	FOR	2.22 mg/mL <sup>abk</sup>	HOS	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2826</a>	C
Ceftazidime	LI	20 mg/mL	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Ceftriaxone sodium	RC	20 mg/mL	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Chlorpromazine HCl	SKF	25 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Chlorpromazine HCl	RPR	0.13 mg/mL <sup>a</sup>	NOV	29.2 units/mL <sup>a</sup>	Visually compatible for 150 min	<a href="#">2244</a>	C
Ciprofloxacin		2 mg/mL		10 units/mL	Turbidity forms rapidly with subsequent white precipitate	<a href="#">1483</a>	I
Ciprofloxacin	MI	2 mg/mL <sup>f</sup>	LY	100 units/mL	Crystals form immediately	<a href="#">1655</a>	I

Ciprofloxacin	BAY	2 mg/mL <sup>b</sup>	CP	10, 100, 1000 units/mL <sup>b</sup>	White precipitate forms immediately	<a href="#">1934</a>	I
Cisatracurium besylate	GW	0.1 and 2 mg/mL <sup>a</sup>	AB	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2074</a>	C
Cisatracurium besylate	GW	5 mg/mL <sup>a</sup>	AB	100 units/mL	White cloudiness forms immediately	<a href="#">2074</a>	I
Cisplatin		1 mg/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. No precipitate seen	<a href="#">980</a>	C
Cladribine	ORT	0.015 <sup>b</sup> and 0.5 <sup>g</sup> mg/mL	WY	100 units/mL <sup>b</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">1969</a>	C
Clarithromycin	AB	4 mg/mL <sup>a</sup>	CPP	1000 units/mL <sup>a</sup>	White cloudiness forms immediately	<a href="#">2174</a>	I
Clindamycin phosphate	UP	12 mg/mL <sup>a</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Cyanocobalamin	PD	0.1 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Cyclophosphamide		20 mg/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. No precipitate seen	<a href="#">980</a>	C
Dacarbazine	MI	25 mg/mL <sup>b</sup>	WY	100 units/mL	White precipitate forms immediately <sup>h</sup>	<a href="#">1158</a>	I
Dacarbazine	MI	10 mg/mL <sup>b</sup>	WY	100 units/mL	No observable precipitation <sup>h</sup>	<a href="#">1158</a>	C
Daptomycin	CUB	19.6 mg/mL <sup>bl</sup>	ES	98 units/mL <sup>bl</sup>	Physically compatible with no loss of either drug in 2 hr at 25 °C	<a href="#">2553</a>	C
Dexamethasone sodium phosphate	ES	0.08 mg/mL <sup>a</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Dexamethasone sodium phosphate	MSD	4 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C

Dexmedetomidine HCl	AB	4 mcg/mL <sup>b</sup>	AB	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2383</a>	C
Diazepam	RC	5 mg/mL	RI	1000 units/L <sup>c</sup>	Immediate haziness and globule formation	<a href="#">322</a>	I
Digoxin	BW	0.25 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C
Diltiazem HCl	MMD	5 mg/mL	LY	20,000 units/mL	Precipitate forms	<a href="#">1807</a>	I
Diltiazem HCl	MMD	1 mg/mL <sup>b</sup>	LY	20,000 units/mL	Visually compatible	<a href="#">1807</a>	C
Diltiazem HCl	MMD	1 <sup>b</sup> and 5 mg/mL	SCN	5000 and 10,000 units/mL	Visually compatible	<a href="#">1807</a>	C
Diltiazem HCl	MMD	5 mg/mL	LY, SCN	80 units/mL <sup>f</sup>	Visually compatible	<a href="#">1807</a>	C
Diltiazem HCl	MMD	1 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C
Diphenhydramine HCl	PD	50 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Dobutamine HCl	LI	4 mg/mL <sup>b</sup>	ES	50 units/mL <sup>b</sup>	Physically compatible for 3 hr	<a href="#">1316</a>	C
Dobutamine HCl	LI	4 mg/mL <sup>a</sup>	ES	50 units/mL <sup>a</sup>	Immediate gross precipitation	<a href="#">1316</a>	I
Dobutamine HCl	LI	1 mg/mL <sup>a</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Dobutamine HCl	LI	4 mg/mL <sup>a</sup>	OR	100 units/mL <sup>a</sup>	Haze and white precipitate form	<a href="#">1877</a>	I
Dobutamine HCl	LI	4 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Precipitate forms in 4 hr at 27 °C	<a href="#">2062</a>	I
Docetaxel	RPR	0.9 mg/mL <sup>a</sup>	ES	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2224</a>	C
Dopamine HCl	ACC	40 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Dopamine HCl	BA	1.6 mg/mL	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Dopamine HCl	AB	3.2 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C

Doripenem	JJ	5 mg/mL <sup>ab</sup>	HOS	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2743</a>	C
Doxapram HCl	RB	2 mg/mL <sup>a</sup>	APP	1 unit/mL <sup>t</sup>	Visually compatible for 4 hr at 23 °C	<a href="#">2470</a>	C
Doxorubicin HCl		2 mg/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. Precipitates immediately	<a href="#">980</a>	I
Doxorubicin HCl liposomal	SEQ	0.4 mg/mL <sup>a</sup>	ES	1000 units/mL <sup>a</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2087</a>	C
Doxycycline hyclate	ES	1 mg/mL <sup>a</sup>	TR	50 units/mL	Visually incompatible within 4 hr at 25 °C	<a href="#">1793</a>	I
Droperidol		2.5 mg/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. Precipitates immediately	<a href="#">980</a>	I
Droperidol	CR	1.25 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Edrophonium chloride	RC	10 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Enalaprilat	MSD	0.05 mg/mL <sup>abk</sup>	IX	40 units/mL <sup>a</sup>	Physically compatible for 24 hr at room temperature under fluorescent light	<a href="#">1355</a>	C
Epinephrine HCl	AB	0.1 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Epinephrine HCl	AB	0.02 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C
Ertapenem sodium	ME	10 mg/mL <sup>b</sup>	APP	40 and 100 units/mL <sup>a</sup>	Visually compatible with about 4% ertapenem loss in 4 hr	<a href="#">2487</a>	C
Ertapenem sodium	ME	10 mg/mL <sup>b</sup>	APP	50 and 100 units/mL <sup>b</sup>	Visually compatible with about 3% ertapenem loss in 4 hr	<a href="#">2487</a>	C

Erythromycin lactobionate	AB	3.3 mg/mL <sup>b</sup>	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Esmolol HCl	DCC	10 mg/mL <sup>a</sup>	IX	40 units/mL <sup>a</sup>	Physically compatible for 24 hr at 22 °C	<a href="#">1169</a>	C
Estrogens, conjugated	AY	5 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C
Ethacrynate sodium	MSD	1 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C
Etoposide phosphate	BR	5 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2218</a>	C
Famotidine	MSD	0.2 mg/mL <sup>a</sup>	ES	40 units/mL <sup>b</sup>	Physically compatible for 14 hr	<a href="#">1196</a>	C
Famotidine	MSD	0.2 mg/mL <sup>a</sup>	TR	50 units/mL <sup>a</sup>	Physically compatible for 4 hr at 25 °C	<a href="#">1188</a>	C
Famotidine	ME	2 mg/mL <sup>b</sup>		40 units/mL <sup>a</sup>	Visually compatible for 4 hr at 22 °C	<a href="#">1936</a>	C
Fenoldopam mesylate	AB	80 mcg/mL <sup>b</sup>	AB	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2467</a>	C
Fentanyl citrate	MN	0.05 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Fentanyl citrate	ES	0.05 mg/mL	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C
Filgrastim	AMG	30 mcg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Particles and filaments form immediately	<a href="#">1687</a>	I
Fluconazole	RR	2 mg/mL	LY	1000 units/mL	Physically compatible for 24 hr at 25 °C	<a href="#">1407</a>	C
Fluconazole	PF	2 mg/mL	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Fludarabine phosphate	BX	1 mg/mL <sup>a</sup>	SO, WY	40 <sup>a</sup> , 100, 1000 units/mL	Visually compatible for 4 hr at 22 °C	<a href="#">1439</a>	C
Fluorouracil	RC	50 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Fluorouracil		50 mg/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. No precipitate	<a href="#">980</a>	C

Foscarnet sodium	AST	24 mg/mL	ES	1000 units/mL	seen Physically compatible for 24 hr at room temperature under fluorescent light	<a href="#">1335</a>	C
Foscarnet sodium	AST	24 mg/mL	LY	100 units/mL <sup>f</sup>	Physically compatible for 24 hr at 25 °C under fluorescent light	<a href="#">1393</a>	C
Furosemide		10 mg/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. No precipitate seen	<a href="#">980</a>	C
Furosemide	HO	10 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Furosemide	AMR	10 mg/mL	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C
Furosemide	HMR	2.6 mg/mL <sup>a</sup>	NOV	29.2 units/mL <sup>a</sup>	Visually compatible for 150 min	<a href="#">2244</a>	C
Gallium nitrate	FUJ	1 mg/mL <sup>b</sup>	ES	40 units/mL <sup>b</sup>	Visually compatible for 24 hr at 25 °C	<a href="#">1673</a>	C
Gemcitabine HCl	LI	10 mg/mL <sup>b</sup>	ES	100 units/mL <sup>b</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2226</a>	C
Gentamicin sulfate	RS	80 mg		<sup>b</sup>	Precipitates immediately	<a href="#">528</a>	I
Gentamicin sulfate	ES	3.2 mg/mL <sup>f</sup>	ES	50 units/mL <sup>f</sup>	Immediate gross haze	<a href="#">1316</a>	I
Gentamicin sulfate	TR	2 mg/mL	TR	50 units/mL	Visually incompatible within 4 hr at 25 °C	<a href="#">1793</a>	I
Granisetron HCl	SKB	0.05 mg/mL <sup>a</sup>	AB	100 units/mL <sup>a</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2000</a>	C
Haloperidol lactate	MN	5 mg/1 mL <sup>i</sup>	OR	25,000 and 50,000 units/250 mL <sup>f</sup>	White precipitate forms immediately	<a href="#">779</a>	I
Hetastarch in lactated electrolyte	AB	6%	ES	100 units/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2339</a>	C
Hydralazine HCl	CI	20 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room	<a href="#">534</a>	C

Hydrocortisone sodium succinate	UP	2 mg/mL <sup>a</sup>	TR	50 units/mL	temperature Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Hydrocortisone sodium succinate	UP	125 mg/mL	ES	100 units/mL <sup>f</sup>	Visually compatible for 24 hr at room temperature in test tubes. No precipitate found on filter from Y-site delivery	<a href="#">2063</a>	C
Hydromorphone HCl	KN	1 mg/mL	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C
Hydroxyethyl starch 130/0.4 in sodium chloride 0.9%	FRK	6%	HOS	10 units/mL	Visually compatible for 24 hr at room temperature	<a href="#">2770</a>	C
Hydroxyethyl starch 130/0.4 in sodium chloride 0.9%	FRK	6%	PP	1000, 10,000 units/mL	Visually compatible for 24 hr at room temperature	<a href="#">2770</a>	C
Idarubicin HCl	AD	1 mg/mL <sup>b</sup>	ES, SO	100 and 1000 units/mL	Haze forms immediately and precipitate forms in 12 to 20 min	<a href="#">1525</a>	I
Insulin, regular	LI	0.2 unit/mL <sup>b</sup>	ES	60 units/mL <sup>a</sup>	Physically compatible for 2 hr at 25 °C	<a href="#">1395</a>	C
Isoproterenol HCl	WI	0.2 mg/mL	UP	1000 units/L <sup>e</sup>	Physically compatible for 4 hr at room temperature	<a href="#">534</a>	C
Isosorbide dinitrate	RP	10 mg/mL	LEO	300 units/mL <sup>a</sup>	Erratic availability of both drugs delivered through PVC tubing	<a href="#">1799</a>	I
Labetalol HCl	SC	1 mg/mL <sup>a</sup>	IX	40 units/mL <sup>a</sup>	Physically compatible for 24 hr at 18 °C	<a href="#">1171</a>	C
Labetalol HCl	GL	5 mg/mL	OR	100 units/mL <sup>a</sup>	Cloudiness with particles forms immediately	<a href="#">1877</a>	I
Labetalol HCl	AH	2 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C
Leucovorin calcium		10 mg/mL		1000 units/mL	Drugs injected sequentially in Y-site with no flush. No precipitate seen	<a href="#">980</a>	C

Levofloxacin	OMN	5 mg/mL <sup>a</sup>	ES	10 units/mL	Cloudy precipitate forms	<a href="#">2233</a>	I
Lidocaine HCl	AST	20 mg/mL	RI	1000 units/L <sup>c</sup>	Physically compatible for 4 hr at room temperature	<a href="#">322</a>	C
Lidocaine HCl	TR	4 mg/mL	TR	50 units/mL	Visually compatible for 4 hr at 25 °C	<a href="#">1793</a>	C
Linezolid	PHU	2 mg/mL	ES	1000 units/mL <sup>a</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2264</a>	C
Lorazepam	WY	0.33 mg/mL <sup>b</sup>		417 units/mL	Visually compatible for 24 hr at 22 °C	<a href="#">1855</a>	C
Lorazepam	WY	0.5 mg/mL <sup>a</sup>	ES	100 units/mL <sup>a</sup>	Visually compatible for 4 hr at 27 °C	<a href="#">2062</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in combination with hydrocortisone sodium succinate (Upjohn) 100 mg/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>d</sup>Given over three minutes into a heparin infusion run at 1 mL/min.

<sup>e</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>f</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>g</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>h</sup>Dacarbazine in intravenous tubing flushed with heparin sodium.

<sup>i</sup>Injected over one minute.

<sup>j</sup>Tested in sterile water for injection.

<sup>k</sup>Tested in Ringer's injection, lactated.

<sup>l</sup>Final concentration after mixing.

<sup>m</sup>Tested in dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>n</sup>Lyophilized formulation tested.

<sup>o</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>p</sup>Tested in dextrose 5% in Ringer's injection.

<sup>q</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>r</sup>Tested with albumin human 0.1%.

<sup>s</sup>Tested in dextrose 5% in sodium chloride 0.225%.

<sup>t</sup>Tested in sodium chloride 0.45%.

<sup>u</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>v</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

---

### **Additional Compatibility Information**

*Parenteral Nutrition Admixtures* — In solutions of amino acids 5% and dextrose 5 or 25% with vitamins or trace elements, heparin activity was retained for 24 hours at 25 °C. However, the activity fell significantly after 24 hours. <sup>(900)</sup>

However, flocculation of fat emulsion (Kabi-Vitrum) was reported during Y-site administration into a line being used to infuse a parenteral nutrition solution containing both calcium gluconate and heparin sodium. Subsequent evaluation indicated that the combination of calcium gluconate (0.46 and 1.8 mM/125 mL) plus heparin sodium (25 and 100 units/125 mL) in amino acids plus dextrose would induce flocculation of the fat emulsion within two to four minutes at concentrations that resulted in no visually apparent flocculation in 30 minutes with either agent alone. <sup>(1214)</sup>

Calcium chloride concentrations of 1 to 20 mM normally result in slow flocculation of fat emulsion 20%, intravenous, over a period of hours. When heparin sodium 5 units/mL was added, the flocculation rate accelerated greatly; a cream layer was observed visually in a few minutes. This effect was not observed when sodium ion was substituted for the divalent calcium. <sup>(1406)</sup>

Destabilization of fat emulsion (Intralipid 20%) was observed when administered simultaneously with a parenteral nutrition admixture. The damage, detected by viscosity measurement, occurred immediately upon contact at the Y-site. The extent of the destabilization was dependent on the concentration of the heparin and the presence of MVI Pediatric with its surfactant content. In addition to the viscosity changes, phase separation was observed in two hours. Parenteral nutrition admixtures containing heparin should never be premixed with fat emulsion as a 3-in-1 total nutrient admixture because of this emulsion destabilization. The damage might be minimized during Y-site co-administration as long as the heparin was kept at a sufficiently low concentration (no visible separation occurred at a heparin concentration of 0.5 unit/mL) and the length of tubing between the Y-site and the patient was minimized. <sup>(2282)</sup>

However, because the damage to emulsion integrity has been found to occur immediately upon mixing with heparin in the presence of the calcium ions in parenteral nutrition admixtures <sup>(1214)</sup> <sup>(2215)</sup> <sup>(2282)</sup> and no evaluation and documentation of the clinical safety of using such destabilized emulsions has been performed, use of such damaged emulsions in patients is suspect.

*Peritoneal Dialysis Solutions* — The activity of heparin 35,000 units/L was evaluated in peritoneal dialysis fluids containing 1.5 and 2.5% dextrose (Dianeal, Travenol). Storage at 25 °C resulted in an apparent temporary 50% loss of heparin activity in four hours with recovery in six hours. Heparin activity was then retained for 14 days at 4 °C. <sup>(900)</sup>

Gentamicin sulfate 10 mg/L with heparin sodium 1000 units/L in Dianeal with dextrose 5% had no significant reduction in gentamicin sulfate concentration or of heparin sodium in four to six hours. <sup>(228)</sup> However, a marked reduction in the anticoagulant activity of heparin sodium occurred if opalescence or a precipitate is formed, which results if the undiluted drugs are combined, even if the precipitate redissolves. Heparin activity was retained if one drug was added to a dilute solution of the other and no precipitate formed. <sup>(295)</sup>

Vancomycin hydrochloride (Lilly) 15 mg/L to 5.3 g/L in Dianeal with dextrose 2.5 or 4.25% was physically compatible with heparin sodium (Organon) 500 to 14,300 units/L for 24 hours at 25 °C under fluorescent light. However, a white precipitate formed immediately in combinations of heparin sodium with vancomycin hydrochloride 6.9 to 14.3 g/L. <sup>(1322)</sup>

*Heparin Locks* — Heparin locks, weak heparin solutions instilled or "locked" into infusion ports or sets through a resealing latex diaphragm, are useful in providing an established intravenous route for intermittent intravenous injections. To maintain patency, a weak heparin solution is left in the tubing. Concentrations of heparin sodium used have varied from about 10 to 1000 units/mL of sodium chloride 0.9%, with 10 and 100 units/mL being the most common. The volume of dilute heparin sodium in sodium chloride 0.9% usually used to flush the set is 0.2 to 1 mL. <sup>(255)</sup> <sup>(256)</sup> <sup>(257)</sup> <sup>(258)</sup> <sup>(405)</sup> <sup>(677)</sup> <sup>(678)</sup> <sup>(901)</sup> <sup>(2119)</sup> However, the use of sodium chloride 0.9% instead of a solution containing heparin has been suggested to maintain patency. Studies have found sodium chloride 0.9% to be as effective in maintaining patency as 10- and 100-unit/mL solutions of heparin. <sup>(902)</sup> <sup>(903)</sup> <sup>(1109)</sup> <sup>(1266)</sup> <sup>(1267)</sup> <sup>(1268)</sup> <sup>(1269)</sup> <sup>(1639)</sup> <sup>(1640)</sup> <sup>(1641)</sup> <sup>(1656)</sup> <sup>(1839)</sup> <sup>(1959)</sup> <sup>(2003)</sup> <sup>(2119)</sup> Other investigators reported that even small amounts of heparin solution are more effective than sodium chloride 0.9% alone. <sup>(678)</sup> <sup>(1270)</sup> <sup>(2120)</sup> <sup>(2121)</sup>

Evaluations of the use of heparinized solutions as locks or continuous flow solutions to help maintain patency in central venous catheters and arterial catheters have resulted in similarly variable results and recommendations. <sup>(2122)</sup> <sup>(2123)</sup> <sup>(2124)</sup> <sup>(2125)</sup> <sup>(2126)</sup> Although use of such heparinized solutions has been generally considered a benign technique causing minimal problems, a number of adverse effects have been reported, especially from solutions with a high heparin concentration and/or

numerous heparin flushes.<sup>(2127) (2128) (2129) (2130) (2131) (2132)</sup>

Vancomycin hydrochloride (Lilly) 25 mcg/mL and heparin sodium (Elkins-Sinn) 100 units/mL in 0.9% sodium chloride injection as a catheter flush solution was evaluated for stability when stored at 4 °C for 14 days. The flush solution was visually clear, and vancomycin activity and heparin activity were retained throughout the storage period. However, an additional 24 hours at 37 °C to simulate use conditions resulted in losses of both agents ranging from 20 to 37%.<sup>(1933)</sup>

Vancomycin hydrochloride 25 mcg/mL combined with heparin sodium (Hospira) 10 units/mL in sterile water for injection for use as a lock solution was found to be physically compatible. Little or no vancomycin loss occurred in 3 days at 4 °C. However, losses of 8% occurred in 3 days at 27 °C and 1 day at 40 °C.<sup>(2820)</sup>

If ciprofloxacin (Sicor) 2 mg/mL was added to this flush solution, a white precipitate appeared within 1 day. Losses of both ciprofloxacin and vancomycin occurred as well.<sup>(2820)</sup>

*Methylprednisolone* — The compatibility of methylprednisolone sodium succinate (Upjohn) with heparin sodium added to an auxiliary medication infusion unit has been studied. Primary admixtures were prepared by adding heparin sodium 10,000 units/L to dextrose 5%, dextrose 5% in sodium chloride 0.9%, and Ringer's injection, lactated. Up to 100 mL of the primary admixture was added along with methylprednisolone sodium succinate (Upjohn) to the auxiliary medication infusion unit with the following results<sup>(329)</sup> :

<b>Methylprednisolone Sodium Succinate</b>	<b>Heparin Sodium 10,000 units/L of Primary Solution</b>	<b>Results</b>
500 mg	D5S, D5W qs 100 mL	Clear solution for 24 hr
500 mg	LR qs 100 mL or added to 100 mL LR	Clear solution for 6 hr
1000 mg	D5S, D5W qs 100 mL	Clear solution for 6 hr
1000 mg	Added to 100 mL D5W	Clear solution for 24 hr
1000 mg	LR qs 100 mL or added to 100 mL LR	Clear solution for 4 to 6 hr
2000 mg	D5W qs 100 mL	Clear solution for 6 hr
2000 mg	D5S, LR qs 100 mL	Clear solution for 24 hr

Heparin Sodium - AHFS 20:12.04.16

## Hetastarch in Lactated Electrolyte - AHFS 40:12

**Products** — Hetastarch 6% in lactated electrolyte is available in 500-mL flexible plastic infusion containers.<sup>(2867)</sup> Each 100 milliliters of solution contains hetastarch 6 g, sodium chloride 672 mg, sodium lactate anhydrous 317 mg, dextrose hydrous 99 mg, calcium chloride dihydrate 37 mg, potassium chloride 22 mg, and magnesium chloride hexahydrate 9 mg in water for injection.<sup>(2867)</sup> The concentrations of electrolytes are shown in Table 1.<sup>(2867)</sup>

**Table 1. Electrolyte Composition**<sup>(2867)</sup>

Electrolyte	mEq/L
Sodium	143
Calcium	5
Potassium	3
Magnesium	0.9
Chloride	124
Lactate	28

*pH* — Approximately 5.9 with negligible buffering capacity.<sup>(2867)</sup>

*Osmolarity* — Approximately 307 mOsm/L.<sup>(2867)</sup>

*Trade Name(s)* — Hextend

**Administration** — Hetastarch 6% in lactated electrolyte is administered by intravenous infusion.<sup>(2867)</sup> The amount of solution and rate of administration depend on the clinical condition and needs of the patient.<sup>(2867)</sup> The product should be inspected for discoloration and particulate matter prior to use.<sup>(2867)</sup> Solutions such as this product that contain calcium should not be administered simultaneously with blood through the same set because of the likelihood of coagulation.<sup>(2867)</sup>

**Stability** — Intact containers of hetastarch 6% in lactated electrolyte should be stored at controlled room temperature and protected from freezing and excessive heat.<sup>(2867)</sup> Brief exposure at temperatures up to 40 °C does not adversely affect the product.<sup>(2867)</sup>

The product is a clear, pale yellow to amber solution.<sup>(2867)</sup> Prolonged exposure to adverse conditions may result in the formation of a turbid deep brown appearance or crystalline precipitate; such solutions should not be used.<sup>(2867)</sup>

Hetastarch in Lactated Electrolyte - AHFS 40:12

## Hetastarch in Sodium Chloride 0.9% - AHFS 40:12

**Products** — Hetastarch is available as a 6% (6 g/100 mL) injection in sodium chloride 0.9% in 500-mL plastic containers. The solution also contains sodium hydroxide for pH adjustment during manufacturing. <sup>(1-8/04)</sup>

*pH* — Approximately pH 5.5. <sup>(1-8/04)</sup>

*Osmolarity* — The product has an osmolarity of 309 mOsm/L. <sup>(1-8/04)</sup> (4)

*Sodium Content* — Hetastarch 6% in sodium chloride 0.9% provides 77 mEq of sodium per 500-mL container. <sup>(4)</sup>

*Trade Name(s)* — Hespan

**Administration** — Hetastarch is given only by intravenous infusion; discard any remaining solution in partially used containers. The dosage and rate of infusion must be individualized to the patient's condition and response. <sup>(1-8/04)</sup> (4)

**Stability** — Hetastarch injection is a clear, pale yellow to amber colloidal solution. The product should be stored at controlled room temperature and protected from freezing and excessive heat. Brief exposure to temperatures up to 40 °C does not affect stability. However, prolonged storage under adverse conditions may result in a crystalline precipitate or a deep brown turbid appearance. Such solutions should not be administered. <sup>(1-8/04)</sup> (4)

Amylose starch has been shown to associate and precipitate over time in solution. <sup>(2296)</sup> Before hetastarch is used, the colloidal solution should be checked for clarity and particulates and the flexible plastic containers should be squeezed to check for small leaks. <sup>(1-8/04)</sup>

### Compatibility Information

#### Additive Compatibility

##### Hetastarch in sodium chloride 0.9%

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Ampicillin sodium		4 g		6%	NS	18% loss in 6 hr and 35% in 24 hr at 20 °C	834	I
Enalaprilat	MSD	25 mg	DU	6%		Physically compatible for 24 hr at room temperature under fluorescent light	1355	C

Hetastarch in Sodium Chloride 0.9% - AHFS 40:12

## Hyaluronidase - AHFS 44:00

**Products** — Hyaluronidase is supplied as a 150-unit/mL solution in 1-mL fill vials. Each milliliter also contains sodium chloride 8.5 mg, edetate disodium 1 mg, calcium chloride 0.4 mg, and thimerosal not more than 0.1 mg in sodium phosphate buffer. [\(1-11/05\)](#)

*pH* — From 6.4 to 7.4. [\(4\)](#)

*Osmolality* — From 295 to 355 mOsm/kg. [\(1-11/05\)](#)

*Trade Name(s)* — Amphadase

**Administration** — Hyaluronidase is administered subcutaneously, intradermally, or intramuscularly along with other drugs or solutions. The solutions should be isotonic for subcutaneous administration. It should not be administered intravenously. [\(1-11/05\)](#) [\(4\)](#)

**Stability** — Hyaluronidase injection in intact vials should be stored under refrigeration at 2 to 8 °C. It should not be used if it is discolored or contains a precipitate. [\(4\)](#)

Hyaluronidase (Wyeth) 75 units/mL in citric acid/sodium citrate buffer (pH 4.5) was found to lose about 7 to 8% activity in 24 hours at 4 and 23 °C. Hyaluronidase activity decreased by 25 to 33% in 48 hours. [\(1907\)](#)

Hyaluronidase - AHFS 44:00

## Hydralazine Hydrochloride - AHFS 24:08.20

**Products** — Hydralazine hydrochloride is available in 1-mL vials. Each milliliter of solution contains hydralazine hydrochloride 20 mg, methylparaben 0.65 mg, propylparaben 0.35 mg, and propylene glycol 103.6 mg in water for injection. The pH may have been adjusted with hydrochloric acid and/or sodium hydroxide. <sup>(1-1/09)</sup>

*pH* — From 3.4 to 4.4. <sup>(1-1/09)</sup>

**Administration** — Hydralazine hydrochloride may be administered intramuscularly or as a rapid direct intravenous injection; the manufacturer does not recommend adding the drug to infusion solutions. <sup>(1-1/09)</sup> <sup>(4)</sup>

**Stability** — Hydralazine hydrochloride in intact vials should be stored at controlled room temperature and protected from freezing. <sup>(1-1/09)</sup> <sup>(4)</sup> Refrigeration of the intact containers may result in precipitation or crystallization. <sup>(593)</sup>

Hydralazine hydrochloride undergoes color changes in most infusion solutions. However, it has been stated that color changes within eight to 12 hours of admixture preparation in solutions stored at 30 °C are not indicative of drug losses. <sup>(4)</sup> The manufacturer does not recommend admixture in infusion solutions. <sup>(1-1/09)</sup>

Hydralazine hydrochloride may react with various metals <sup>(1-1/09)</sup> to yield discolored solutions, often yellow or pink. One report indicated a pink discoloration in prefilled syringes when the hydralazine hydrochloride had been drawn up through filter needles (Monoject) with a stainless steel filter and stored for up to 12 hours. The reaction is not specific to any one metal. Consequently, contact with metal parts should be minimized, and hydralazine hydrochloride should be prepared just prior to use. <sup>(906)</sup>

*pH Effects* — Hydralazine hydrochloride exhibits maximum stability at pH 3.5 and is stable over the pH range of 3 to 5. It undergoes more rapid decomposition as the pH becomes alkaline. <sup>(106)</sup> <sup>(466)</sup>

*Light Effects* — Exposure to light increases the rate of hydralazine hydrochloride decomposition during long-term storage. At a concentration of 0.35 mg/mL in sodium chloride 0.9% in glass bottles, 10% decomposition was calculated to occur in 14.4 weeks in the dark and 12.3 weeks under fluorescent light. In PVC containers, decomposition occurs more rapidly; a 10% loss was calculated to occur in 12.8 weeks in the dark and 9.9 weeks under fluorescent light. <sup>(1561)</sup>

*Sorption* — Hydralazine hydrochloride 27 mg/L in sodium chloride 0.9% in PVC bags exhibited approximately 10% loss in one week at 15 to 20 °C due to sorption. <sup>(536)</sup> However, no loss due to sorption occurred during a seven-hour simulated infusion through an infusion set consisting of a cellulose propionate burette chamber and 170 cm of PVC tubing. <sup>(606)</sup>

Hydralazine hydrochloride was shown not to exhibit sorption to polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(606)</sup>

Hydralazine Hydrochloride - AHFS 24:08.20

## Hydrocortisone Sodium Succinate - AHFS 68:04

**Products** — Hydrocortisone sodium succinate is available in a variety of sizes and containers<sup>(4)</sup>, including 100-mg conventional vials containing hydrocortisone sodium succinate equivalent to hydrocortisone 100 mg with monobasic sodium phosphate anhydrous 0.8 mg and dibasic sodium phosphate dried 8.73 mg. Reconstitute the vial by adding not more than 2 mL of bacteriostatic water for injection or bacteriostatic sodium chloride injection.<sup>(1-5/08)</sup>

Hydrocortisone sodium succinate is also supplied in "Act-O-Vial" containers of 100, 250, 500, and 1000 mg. For the "Act-O-Vial" containers, press the plastic activator down to force the diluent into the lower chamber. Agitate gently to dissolve the drug. When reconstituted, each milliliter of solution contains<sup>(1-5/08)</sup> :

<b>Component</b>	<b>100 mg</b>	<b>250, 500, 1000 mg</b>
Hydrocortisone equivalent (as sodium succinate)	50 mg	125 mg
Monobasic sodium phosphate anhydrous	0.4 mg	1 mg
Dibasic sodium phosphate dried	4.38 mg	11 mg
Benzyl alcohol	~9 mg	~8.3 mg
Water for injection	qs	qs

The pH has been adjusted when necessary with sodium hydroxide.

*pH* — From 7 to 8.<sup>(1-5/08)</sup> (4)

*Osmolality* — The osmolality of hydrocortisone sodium succinate (Abbott) 50 mg/mL was determined to be 292 mOsm/kg by freezing-point depression and 260 mOsm/kg by vapor pressure.<sup>(1071)</sup>

*Sodium Content* — Hydrocortisone sodium succinate contains 2.066 mEq of sodium per gram of drug.<sup>(846)</sup>

*Trade Name(s)* — Solu-Cortef

**Administration** — Hydrocortisone sodium succinate may be administered by intramuscular injection, direct intravenous injection over 30 seconds to several minutes, or continuous or intermittent intravenous infusion at a concentration of 0.1 to 1 mg/mL in a compatible infusion solution. Benzyl alcohol-containing products should not be used in premature infants.<sup>(1-5/08)</sup> (4)

**Stability** — Hydrocortisone sodium succinate in intact containers should be stored at controlled room temperatures of 20 to 25 °C.<sup>(1-5/08)</sup> After reconstitution, solutions are stable at controlled room temperature or below if protected from light. The solution should only be used if it is clear. Unused solutions should be discarded after three days. Hydrocortisone sodium succinate is heat labile and must not be autoclaved.<sup>(1-5/08)</sup> (4)

*pH Effects* — Hydrocortisone sodium succinate is optimally stable at pH 7 to 8. It is stable for 72 hours at pH 6 and for 12 hours at pH 5. More acidic solutions cause precipitation.<sup>(41)</sup>

Solutions of hydrocortisone buffered to pH 9.1 showed oxidation to 21-dehydrocortisone at rates of 1.6 to 2.8%/hr at 26 °C. This rate is four or five times greater than that observed at pH 6.9 to 7.9.<sup>(531)</sup>

*Freezing Solutions* — Hydrocortisone sodium succinate (Upjohn) 500-mg/4 mL reconstituted solution exhibited no loss over four weeks when stored frozen.<sup>(69)</sup>

*Intrathecal Injections* — In a study of solutions for intrathecal injection, hydrocortisone sodium

succinate (Upjohn) was reconstituted to a concentration of 1 mg/mL with Elliott's B solution (295 mOsm/kg, pH 7.3), sodium chloride 0.9% (296 mOsm/kg, pH 7), and Ringer's injection, lactated (258 mOsm/kg, pH 7). In Ringer's injection, lactated, and sodium chloride 0.9%, no decomposition was observed in 24 hours at room temperature under fluorescent light or at 30 °C. However, in seven days, approximately 10% decomposition occurred at room temperature and about 15% at 30 °C. In Elliott's B solution, hydrocortisone sodium succinate is much less stable. In 24 hours, a 7% loss occurred at room temperature and a 12% loss occurred at 30 °C, increasing to 21 and 32%, respectively, at 72 hours. Less than 10% decomposition of this combination occurred in four to eight hours.<sup>(327)</sup>

In another study, the stability and compatibility of cytarabine (Upjohn), methotrexate (NCI), and hydrocortisone (Upjohn), mixed together in intrathecal injections, were evaluated. Two combinations were tested: (1) cytarabine 50 mg, methotrexate 12 mg (as the sodium salt), and hydrocortisone 25 mg (as the sodium succinate salt); and (2) cytarabine 30 mg, methotrexate 12 mg (as the sodium salt), and hydrocortisone 15 mg (as the sodium succinate salt). Each drug combination was added to 12 mL of Elliott's B solution (NCI), sodium chloride 0.9% (Abbott), dextrose 5% (Abbott), and Ringer's injection, lactated (Abbott), and stored for 24 hours at 25 °C. Cytarabine and methotrexate were both chemically stable, with no drug loss after the full 24 hours in all solutions. Hydrocortisone was also stable in the sodium chloride 0.9%, dextrose 5%, and Ringer's injection, lactated, with about a 2% drug loss. However, in Elliott's B solution, hydrocortisone was significantly less stable, with a 6% loss in the 25-mg concentration over 24 hours. The 15-mg concentration was worse, with a 5% loss in 10 hours and a 13% loss in 24 hours. The higher pH of Elliott's B solution and the lower concentration of hydrocortisone may have been factors in this increased decomposition. All mixtures were physically compatible for 24 hours, but a precipitate formed after several days of storage.<sup>(819)</sup>

Hydrocortisone sodium succinate (Upjohn) 2 mg/mL diluted in Elliott's B solution (Orphan Medical) was packaged as 20 mL in 30-mL glass vials and 20-mL plastic syringes (Becton Dickinson) with Red Cap (Burr) Luer-lok syringe tip caps. The solution was physically compatible and chemically stable exhibiting about 9% or less loss in 24 hours at 23 °C and 7% or less loss in 48 hours at 4 °C.<sup>(1976)</sup>

Bacterially contaminated intrathecal solutions could pose grave risks and, consequently, such solutions should be administered as soon as possible after preparation.<sup>(328)</sup>

*Syringes* — Hydrocortisone sodium succinate (Upjohn) 10 mg/mL in sodium chloride 0.9% was packaged in polypropylene syringes (Becton Dickinson) and stored under refrigeration at 5 °C and at room temperature of 25 °C. The drug solution remained clear throughout the study, and about 2% hydrocortisone loss occurred after 21 days under refrigeration. At room temperature, about 5% loss occurred in three days and 10% loss occurred in seven days. Stability in glass containers was found to be comparable.<sup>(2331)</sup>

Hydrocortisone sodium succinate (Pharmacia) 50 mg/mL in sterile water for injection packaged in polypropylene syringes (Braun) was visually compatible with calculated shelf lives of 6.8 days at room temperature and 81 days under refrigeration.<sup>(2654)</sup>

*Sorption* — Hydrocortisone sodium succinate was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>(12) (536) (606)</sup>

*Filtration* — Hydrocortisone sodium succinate (Upjohn) 10 mg/L in dextrose 5% and sodium chloride 0.9% did not display significant sorption to a 0.45- $\mu$ m cellulose membrane filter (Abbott S-A-I-F) during an eight-hour simulated infusion.<sup>(567)</sup>

*Central Venous Catheter* — Hydrocortisone sodium succinate (Abbott) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWgard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

## Compatibility Information

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in combination with heparin sodium (Riker) 1000 units/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>d</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>e</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>f</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>g</sup>Tested in dextrose 5% in Ringer's injection.

<sup>h</sup>Tested in Ringer's injection, lactated.

<sup>i</sup>Lyophilized formulation tested.

<sup>j</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>k</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>l</sup>Tested in dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>m</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

Hydrocortisone Sodium Succinate - AHFS 68:04

## Hydromorphone Hydrochloride - AHFS 28:08.08

**Products** — Hydromorphone hydrochloride is available in 1-mL ampuls and 20-mL multiple-dose vials. In ampuls, each milliliter of the solution contains hydromorphone hydrochloride 1, 2, or 4 mg with sodium citrate 0.2% and citric acid 0.2%. In vials, each milliliter of the solution contains hydromorphone hydrochloride 2 mg, edetate disodium 0.5 mg, methylparaben 1.8 mg, and propylparaben 0.2 mg. Sodium hydroxide or hydrochloric acid may have been used to adjust the pH of the solutions in vials.<sup>(1)</sup>

Hydromorphone hydrochloride is also available in 1- and 5-mL amber ampuls and 50-mL single-dose vials as a high potency form (Dilaudid-HP). Each milliliter of the solution contains 10 mg of hydromorphone hydrochloride with citric acid 0.2% and sodium citrate 0.2%.<sup>(1)</sup>

In addition to the liquid dosage forms, high potency hydromorphone hydrochloride (Dilaudid-HP) is available as a 250-mg single-dose vial as a lyophilized powder. Reconstitute with 25 mL of sterile water for injection to yield a 10-mg/mL solution.<sup>(1)</sup>

*pH* — From 4 to 5.5.<sup>(4)</sup>

*Trade Name(s)* — Dilaudid, Dilaudid-HP

**Administration** — Hydromorphone hydrochloride may be administered by subcutaneous, intramuscular, or slow direct intravenous injection over at least two to three minutes.<sup>(1) (4)</sup>

**Stability** — Hydromorphone hydrochloride products should be stored at controlled room temperature and protected from light.<sup>(1)</sup> The liquid dosage forms in intact ampuls or vials should not be stored under refrigeration because of possible precipitation or crystallization. Resolubilization at room temperature or on warming may be performed without affecting the stability of the drug.<sup>(593)</sup> The manufacturer recommends inspecting for particulate matter or discoloration. A slight yellowish discoloration may develop in both the ampuls and vials, but it has not been associated with drug loss.<sup>(1) (4)</sup>

Extemporaneously prepared hydromorphone hydrochloride 10 and 50 mg/mL, stored in 100-mL glass vials or PVC bags, exhibited no loss in 42 days at 4 and 23 °C.<sup>(1394)</sup>

*Syringes* — Hydromorphone hydrochloride (Knoll) 10 mg/mL undiluted and diluted to 0.1 mg/mL in sodium chloride 0.9% was packaged as 3 mL in 10-mL polypropylene infusion pump syringes (Pharmacia Deltec). No loss occurred over 30 days at 30 °C.<sup>(1967)</sup>

Hydromorphone hydrochloride 1.5 and 80 mg/mL in sodium chloride 0.9% packaged as 20 mL in 30-mL polypropylene syringes was evaluated for physical and chemical stability. Sample solutions were stored for 60 days at 4 °C protected from light and 23 °C exposed to normal fluorescent light. Other sample solutions were stored frozen at -20 °C and at elevated temperature of 37 °C for two days to simulate more extreme conditions during express shipping. About 2 to 5% loss occurred in 60 days at 4 and 23 °C. The frozen and 37 °C samples exhibited little change in concentration in two days. However, samples stored frozen at -20 °C exhibited the formation of microparticulates in the thousands per milliliter, possibly shed by the syringe components.<sup>(2377)</sup>

*Implantable Pumps* — The stability of hydromorphone hydrochloride 2 (Dilaudid) and 10 (Dilaudid-HP) mg/mL was evaluated in SynchroMed implantable pumps over 16 weeks at 37 °C. Little or no drug loss and no adverse effects on the pumps occurred.<sup>(2584)</sup>

*Central Venous Catheter* — Hydromorphone hydrochloride (Knoll) 0.5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no

drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Hydromorphone HCl

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in Ringer's injection	CU	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Dextrose 5% in Ringer's injection, lactated	MG	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Dextrose 5%	TR <sup>b</sup>	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Dextrose 5%	MG <sup>c</sup>	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Dextrose 5%	<sup>b</sup>	KN	1 and 5 g	No loss in 42 days at 4 and 23 °C	1394	C
Dextrose 5% in sodium chloride 0.45%	MG	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Dextrose 5% in sodium chloride 0.9%	MG	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Ringer's injection	MG	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Ringer's injection, lactated	MG	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Sodium chloride 0.45%	MG	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Sodium chloride 0.9%	TR <sup>b</sup>	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Sodium chloride 0.9%	MG <sup>c</sup>	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C
Sodium chloride 0.9%	<sup>b</sup>	KN	1 and 5 g	No loss in 42 days at 4 and 23 °C	1394	C
Sodium chloride 0.9%	AB <sup>b</sup>	KN	20 and 100 mg	Visually compatible. Little or no loss in 72 hr at 24 °C under fluorescent light	1870	C
Sodium chloride 0.9%	BA <sup>d</sup>	<sup>e</sup>	1.5 to 80 g	Physically compatible. 2 to 5% hydromorphone loss in 60 days at 4 °C protected from light and 23 °C under fluorescent light	2377	C
Sodium chloride 0.9%	<sup>f</sup>	BA	200 mg	Under 8% loss in 112 days at 4 and 20 °C	2818	C
Sodium lactate (1/6) M	CU	KN <sup>a</sup>	80 mg	Physically compatible. No loss in 24 hr at 25 °C	572	C

<sup>a</sup>Both ampul and vial formulations tested.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Tested in polyolefin containers.

<sup>d</sup>Tested in polypropylene syringes.

<sup>e</sup>Extemporaneously compounded from hydromorphone hydrochloride powder.

<sup>f</sup>Tested in PCA injectors.

### Additive Compatibility

Fluorouracil	AB	16 g	AST	500 mg	D5W, NS <sup>a</sup>	Physically compatible. Little loss of either drug in 3 days at 32 °C, 7 days at 23 °C, and 35 days at 4 and -20 °C	<a href="#">1977</a>	C
Heparin sodium	OR	1000 units	KN	20 g	D5W <sup>a</sup>	Visually compatible with no loss of hydromorphone in 18 days at 4 and 23 °C. Heparin not tested	<a href="#">2410</a>	C
Heparin sodium	OR	500 units	KN	5 g	D5W <sup>a</sup>	Visually compatible with no loss of hydromorphone in 18 days at 4 and 23 °C. Heparin not tested	<a href="#">2410</a>	C
Heparin sodium	OR	8000 units	KN	5 g	D5W <sup>a</sup>	Visually compatible with no loss of hydromorphone in 18 days at 4 and 23 °C. Heparin not tested	<a href="#">2410</a>	C
Ketamine HCl	SZ	200 mg, 600 mg, 1 g	SZ	200 mg	NS <sup>d</sup>	Visually compatible. Under 10% loss of both drugs in 7 days at 25 °C	<a href="#">2799</a>	C
Midazolam HCl	RC	0.1 to 4.5 g	KN	0.5 to 45 g	D5W, NS	Visually compatible for 24 hr at room temperature	<a href="#">2086</a>	C
Midazolam HCl	RC	100 and 500 mg	KN	2 and 20 g	D5W, NS	Visually compatible. Under 7% hydromorphone and midazolam loss in 23 days at 4 and 23 °C	<a href="#">2086</a>	C
Ondansetron HCl	GL	100 mg and 1 g	ES	500 mg	NS	Physically compatible. No loss of either drug in 7 days at 32 °C or 31 days at 4 and 22 °C protected from light	<a href="#">1690</a>	C

Potassium chloride	AST	0.5 and 1 mEq/mL	KN	2 and 20 mg/mL	D5W <sup>a</sup>	Visually compatible with no loss of hydromorphone in 18 days at 4 and 23 °C. Potassium chloride not tested	<a href="#">2410</a>	C
Promethazine HCl	ES	300 mg	KN	1 g	NS <sup>a</sup>	Visually compatible for 21 days at 4 and 25 °C	<a href="#">1992</a>	C
Verapamil HCl	KN	80 mg	KN	16 mg	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C
Ziconotide acetate	ELN	25 mg <sup>b</sup>	BB	35 g <sup>c</sup>		90% ziconotide retained for 19 days at 37 °C. No hydromorphone loss in 25 days	<a href="#">2702</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in SynchroMed implantable pumps.

<sup>c</sup>Hydromorphone HCl powder dissolved in ziconotide acetate injection.

<sup>d</sup>Tested in amber glass and PVC containers.

### Drugs in Syringe Compatibility

#### Hydromorphone HCl

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Ampicillin sodium	AY	250 mg/1 mL	KN	2, 10, 40 mg/1 mL	Visually compatible but 10% loss of ampicillin in 5 hr at room temperature	<a href="#">2082</a>	I
Atropine sulfate	ES	0.4 mg/0.5 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Bupivacaine HCl	AST	7.5 mg/mL	KN	65 mg/mL	Visually compatible for 30 days at 25 °C	<a href="#">1660</a>	C
Cefazolin sodium	SKF	>200 mg/1 mL	KN	2, 10, 40 mg/1 mL	Precipitate forms	<a href="#">2082</a>	I
Cefazolin sodium	SKF	150 mg/1 mL	KN	2, 10, 40 mg/1 mL	Visually compatible with less than 10% loss of each drug in 24 hr at room temperature	<a href="#">2082</a>	C
Ceftazidime	GL	180 mg/1 mL	KN	2, 10, 40 mg/1 mL	Visually compatible with less than 10% loss of either drug in 24 hr at room temperature	<a href="#">2082</a>	C
Chlorpromazine HCl	ES	25 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Cloxacillin sodium	AY	250 mg/1 mL	KN	2, 10, 40 mg/1 mL	Precipitate forms but dissipates with shaking. Under 10% loss of both drugs in 24 hr at room temperature	<a href="#">2082</a>	?
Dexamethasone sodium phosphate	SX	4 mg/mL <sup>b</sup>	KN	2, 10, 40 mg/mL <sup>b</sup>	Visually compatible and both drugs stable for 24 hr at 24 °C	<a href="#">1542</a>	C

Dexamethasone sodium phosphate	DB	10 mg/mL <sup>b</sup>	KN	2 and 10 mg/mL <sup>b</sup>	Visually compatible and both drugs stable for 24 hr at 24 °C	<a href="#">1542</a>	C
Dexamethasone sodium phosphate	DB	10 mg/mL <sup>b</sup>	KN	40 mg/mL <sup>b</sup>	White turbidity forms immediately	<a href="#">1542</a>	I
Dexamethasone sodium phosphate	DB	7.1 mg/mL <sup>c</sup>	KN	11.6 mg/mL <sup>c</sup>	Visually compatible for 24 hr at 24 °C	<a href="#">1542</a>	C
Dexamethasone sodium phosphate	DB	5.5 to 6.6 mg/mL <sup>c</sup>	KN	13.3 to 17.5 mg/mL <sup>c</sup>	Precipitate forms	<a href="#">1542</a>	I
Dexamethasone sodium phosphate	DB	4.75 mg/mL <sup>c</sup>	KN	10.5 mg/mL <sup>c</sup>	Visually compatible for 24 hr at 24 °C	<a href="#">1542</a>	C
Dexamethasone sodium phosphate	DB	3 to 4.1 mg/mL <sup>c</sup>	KN	14.75 to 25 mg/mL <sup>c</sup>	Precipitate forms	<a href="#">1542</a>	I
Dexamethasone sodium phosphate	SX	3.34 mg/mL <sup>c</sup>	KN	26.66 mg/mL <sup>c</sup>	Visually compatible for 24 hr at 24 °C	<a href="#">1542</a>	C
Diazepam	SX	5 mg/1 mL	KN	2, 10, 40 mg/1 mL	Diazepam precipitate forms immediately due to aqueous dilution	<a href="#">2082</a>	I
Dimenhydrinate	SQ	50 mg/1 mL	KN	2, 10, 40 mg/1 mL	Visually compatible with both drugs stable for 24 hr at 4, 23, and 37 °C. Precipitate forms after 24 hr	<a href="#">1776</a>	C
Dimenhydrinate		10 mg/1 mL		50 mg/1 mL	Precipitate forms in about 2 hr	<a href="#">2569</a>	I
Diphenhydramine HCl	PD	50 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Fentanyl citrate	MN	0.05 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Glycopyrrolate	RB	0.2 mg/1 mL	KN	2 mg/1 mL	Physically compatible. pH in glycopyrrolate stability range for 48 hr at 25 °C	<a href="#">331</a>	C
Glycopyrrolate	RB	0.2 mg/1 mL	KN	4 mg/2 mL	Physically compatible. pH in glycopyrrolate stability range for 48 hr at 25 °C	<a href="#">331</a>	C
Glycopyrrolate	RB	0.4 mg/2 mL	KN	2 mg/1 mL	Physically compatible. pH in glycopyrrolate stability range for 48 hr at 25 °C	<a href="#">331</a>	C
Haloperidol lactate	MN	1 <sup>d</sup> , 2 <sup>d</sup> , 5 mg/1 mL	KN	1 <sup>d</sup> and 10 mg/1 mL	Visually compatible for 24 hr at 25 °C under fluorescent light	<a href="#">1785</a>	C
Haloperidol lactate	MN	2 mg/mL	KN	10 and 15 mg/mL	White precipitate of haloperidol forms immediately	<a href="#">668</a>	I
Heparin sodium	OR	10 units/1 mL	KN	50 mg/1 mL	White cloudy precipitate	<a href="#">2410</a>	I
Heparin sodium	LEO	100 units/1 mL	KN	50 mg/1 mL	White cloudy precipitate	<a href="#">2410</a>	I
Heparin sodium	OR	25,000 units/1 mL	KN	50 mg/1 mL	White cloudy precipitate	<a href="#">2410</a>	I
Hyaluronidase	WY	150 units/mL <sup>e</sup>	KN	2 mg/mL <sup>e</sup>	43 and 56% hyaluronidase loss in 24 hr at 4 and 23 °C, respectively	<a href="#">1907</a>	I

Hyaluronidase	WY	150 units/mL <sup>e</sup>	KN	10 and 40 mg/mL <sup>e</sup>	70 to 82% hyaluronidase loss in 24 hr at 4 and 23 °C	<a href="#">1907</a>	I
Hydroxyzine HCl	PF	50 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Hydroxyzine HCl	PF	100 mg/2 mL	KN	0.75 mg/0.8 mL	Physically compatible	<a href="#">771</a>	C
Ketamine HCl	SZ	0.2, 0.6, 1 mg/mL <sup>j</sup>	SZ	0.2 mg/mL <sup>j</sup>	Visually compatible. Under 10% loss of both drugs in 7 days at 25 °C	<a href="#">2799</a>	C
Ketorolac tromethamine	SY	30 mg/1 mL	KN	10 mg/1 mL	Cloudiness forms immediately but clears with swirling	<a href="#">1785</a>	?
Ketorolac tromethamine	SY	30 mg/1 mL	KN	1 mg/1 mL <sup>d</sup>	Visually compatible for 24 hr at 25 °C under fluorescent light	<a href="#">1785</a>	C
Ketorolac tromethamine	SY	15 mg/1 mL <sup>d</sup>	KN	1 <sup>d</sup> and 10 mg/1 mL	Visually compatible for 24 hr at 25 °C under fluorescent light	<a href="#">1785</a>	C
Lorazepam	WY	4 mg/1 mL	KN	2, 10, 40 mg/1 mL	Visually compatible. 10% lorazepam loss in 6 days at 4 °C, 4 days at 23 °C, and 24 hr at 37 °C. Little hydromorphone loss in 7 days at all temperatures	<a href="#">1776</a>	C
Methotrimeprazine HCl	LE	10 mg/mL	KN	10 mg/mL	Visually compatible with less than 10% loss of either drug in 7 days at 8 °C	<a href="#">668</a>	C
Metoclopramide HCl	RB	5 mg/mL	KN	10 and 20 mg/mL	Visually compatible with less than 10% loss of either drug in 7 days at 8 °C	<a href="#">668</a>	C
Midazolam HCl	RC	5 mg/1 mL	WB	2 mg/0.5 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Pantoprazole sodium	<sup>i</sup>	4 mg/1 mL		10 mg/1 mL	Whitish precipitate forms within 4 hr	<a href="#">2574</a>	I
Pentazocine lactate	WI	30 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Pentobarbital sodium	AB	50 mg/1 mL	KN	4 mg/2 mL <sup>f</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Pentobarbital sodium	AB	50 mg/1 mL	KN	4 mg/2 mL <sup>g</sup>	Transient precipitate that dissipates after mixing and stays clear for 30 min	<a href="#">517</a>	?
Phenobarbital sodium	AB	120 mg/1 mL	KN	2, 10, 40 mg/1 mL	Precipitate forms immediately but dissipates with shaking. Phenobarbital precipitates after 6 hr at room temperature	<a href="#">2082</a>	I
Phenytoin sodium	AB	50 mg/1 mL	KN	2, 10, 40 mg/1 mL	White precipitate of phenytoin forms immediately	<a href="#">2082</a>	I

Potassium chloride	AST	2 mEq/1 mL	KN	50 mg/1 mL	Visually compatible for 24 hr at room temperature	<a href="#">2410</a>	C
Prochlorperazine edisylate	SKF	5 mg/1 mL	KN	4 mg/2 mL <sup>f</sup>	Precipitates immediately	<a href="#">517</a>	I
Prochlorperazine edisylate	SKF	5 mg/1 mL	KN	4 mg/2 mL <sup>g</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Prochlorperazine mesylate	RP	5 mg/1 mL	KN	2, 10, 40 mg/1 mL	Visually compatible. Little or no loss of either drug in 7 days at 4, 23, and 37 °C	<a href="#">1776</a>	C
Prochlorperazine mesylate	RP	1.5 mg/mL <sup>j</sup>	SX	0.5 mg/mL <sup>i</sup>	Physically compatible for 96 hr at room temperature exposed to light	<a href="#">2171</a>	C
Promethazine HCl	WY	50 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Promethazine HCl	WY	25 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Ranitidine HCl	GL	50 mg/2 mL	PE	2 mg/1 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Salbutamol	GL	2.5 mg/2.5 mL <sup>b</sup>	KN	1 mg/0.5 mL	Physically compatible for 1 hr	<a href="#">1904</a>	C
Scopolamine HBr	BW	0.43 mg/0.5 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Trimethobenzamide HCl	BE	100 mg/1 mL	KN	4 mg/2 mL <sup>a</sup>	Physically compatible for 30 min	<a href="#">517</a>	C
Ziconotide acetate	ELN	25 mcg/mL	BB	35 mg/mL <sup>k</sup>	No loss of either drug in 25 days at 5 °C	<a href="#">2702</a>	C

<sup>a</sup>Both ampul and vial formulations tested.

<sup>b</sup>Mixed in equal quantities. Final concentration is one-half the indicated concentration.

<sup>c</sup>Mixed in varying quantities to yield the final concentrations noted.

<sup>d</sup>Dilution prepared in sterile water for injection.

<sup>e</sup>Mixed in equal quantities for testing.

<sup>f</sup>Vial formulation tested.

<sup>g</sup>Ampul formulation tested.

<sup>h</sup>Both preserved (benzyl alcohol 0.9%; benzalkonium chloride 0.01%) and unpreserved sodium chloride 0.9% were used as a diluent.

<sup>i</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>j</sup>Diluted in sodium chloride 0.9%.

<sup>k</sup>Hydromorphone HCl powder dissolved in ziconotide acetate injection.

### **Y-Site Injection Compatibility (1:1 Mixture)**

## Hydroxyethyl Starch 130/0.4 6% in Sodium Chloride 0.9% - AHFS 40:12

**Products** — Hydroxyethyl starch 130/0.4 is available as a 6% (6 g/100 mL) in sodium chloride 0.9% in 500-mL plastic containers. The solution also contains sodium hydroxide or hydrochloric acid for pH adjustment during manufacturing. [\(1-12/07\)](#)

*pH* — From 4.0 to 5.5. [\(1-12/07\)](#)

*Osmolarity* — The calculated osmolarity is 308 mOsm/L. [\(1-12/07\)](#)

*Sodium Content* — The product provides 77 mEq of sodium per 500-mL container. [\(1-12/07\)](#)

*Trade Name(s)* — Voluven

**Administration** — Hydroxyethyl starch 130/0.4 6% in sodium chloride 0.9% is given by intravenous infusion only. Any remaining solution in partially used containers should be discarded. The dosage and rate of infusion should be individualized to the patient's condition and response. The container is made of non-DEHP plastic and is latex free. The container does not require a vented set. If using pressure infusion, withdraw or expel air from the container through the medication/administration port prior to infusion. [\(1-12/07\)](#)

**Stability** — Hydroxyethyl starch 130/0.4 6% in sodium chloride 0.9% is a clear to slightly opalescent colorless to slightly yellow colloidal solution. The product should be stored at controlled room temperature and protected from freezing. The bag of solution should not be removed from the overwrap until immediately before use. It should only be administered if the solution is clear and free from particles. The solution should be administered immediately after insertion of the administration set. [\(1-12/07\)](#)

Hydroxyethyl Starch 130/0.4 6% in Sodium Chloride 0.9% - AHFS 40:12

## Hydroxyzine Hydrochloride - AHFS 28:24.92

**Products** — Hydroxyzine hydrochloride is available as a 25-mg/mL solution in 1-mL vials and 10-mL multiple-dose vials. It is also available as a 50-mg/mL solution in 1- and 2-mL single-dose vials and 10-mL multiple-dose vials. Also present in the solutions are benzyl alcohol 0.9% and sodium hydroxide and/or hydrochloric acid to adjust the pH. <sup>(1-11/06)</sup> (4)

*pH* — From 3.5 to 6. <sup>(17)</sup>

**Administration** — Hydroxyzine hydrochloride may be administered undiluted by intramuscular injection only, preferably into the upper outer quadrant of the buttock or the midlateral thigh muscles in adults. In children, the midlateral muscles of the thigh are preferred. <sup>(1-11/06)</sup> (4)

**Stability** — Hydroxyzine should be stored at controlled room temperature and protected from freezing and excessive temperatures. <sup>(1-11/06)</sup> (4)

Vinorelbine tartrate BW 1 mg/mL<sup>b</sup> ES 4 mg/mL<sup>b</sup> Physically compatible for 4 hr at 22 °C 1558 C

---

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Lyophilized formulation tested.

<sup>f</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>g</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>h</sup>Tested in Ringer's injection, lactated.

<sup>i</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

---

### **Additional Compatibility Information**

*Chlorpromazine and Meperidine* — Chlorpromazine hydrochloride (Elkins-Sinn) 6.25 mg/mL, hydroxyzine hydrochloride (Pfizer) 12.5 mg/mL, and meperidine hydrochloride (Winthrop) 25 mg/mL, in both glass and plastic syringes, were reported to be physically compatible and chemically stable for at least one year at 4 and 25 °C when protected from light.<sup>(989)</sup>

Hydroxyzine Hydrochloride - AHFS 28:24.92

## Ibuprofen Lysinate - AHFS 28:08.04.92

**Products** — Ibuprofen lysinate is available as a preservative-free injection containing in each milliliter the l-lysine salt of ( $\pm$ ) ibuprofen 17.1 mg (equivalent to ibuprofen 10 mg) with sodium hydroxide and/or hydrochloric acid to adjust pH during manufacturing in water for injection. The injection is packaged in single-use 2-mL vials. <sup>(1-7/07)</sup>

*pH* — About 7.0. <sup>(1-7/07)</sup>

*Trade Name(s)* — NeoProfen

**Administration** — Ibuprofen lysinate is administered intravenously after dilution in a suitable volume of dextrose or saline infusion solution. The drug should be prepared and administered within 30 minutes of preparation by intravenous infusion over 15 minutes taking care to avoid extravasation. <sup>(1-7/07)</sup>

**Stability** — Intact vials of ibuprofen lysinate should be stored at controlled room temperature protected from light. The manufacturer recommends retaining the vials in their carton until use. <sup>(1-7/07)</sup>

After dilution in an appropriate volume of dextrose or saline intravenous infusion solution, ibuprofen lysinate should be administered within 30 minutes over a period of 15 minutes. Any remaining solution in the single-use vials should be discarded because no antimicrobial preservative is present. The manufacturer recommends not administering ibuprofen lysinate into a line running a TPN admixture; the TPN should be interrupted if necessary for 15 minutes both before and after administering ibuprofen lysinate maintaining line patency using dextrose or saline infusion solution. <sup>(1-7/07)</sup>

Ibuprofen Lysinate - AHFS 28:08.04.92

## Idarubicin Hydrochloride - AHFS 10:00

**Products** — Idarubicin hydrochloride is available as a 1-mg/mL orange-red solution in single-use vials containing 5, 10, and 20 mL. In addition to the drug, each milliliter also contains glycerin 25 mg and hydrochloric acid to adjust pH in water for injection. <sup>(1-8/07)</sup>

*pH* — The idarubicin hydrochloride has been adjusted with hydrochloric acid to a target pH of 3.5. <sup>(1-8/07)</sup>

*Trade Name(s)* — Idamycin PFS

**Administration** — Idarubicin hydrochloride should be administered by slow intravenous injection over 10 to 15 minutes into the tubing of a running infusion of sodium chloride 0.9% or dextrose 5%. The drug should not be given subcutaneously or intramuscularly, and extravasation should be avoided to prevent severe tissue necrosis. Care should be exercised during dose preparation to avoid inadvertent skin contact with the drug. <sup>(1-8/07)</sup>

**Stability** — Idarubicin hydrochloride in intact vials should be stored under refrigeration at 2 to 8 °C and protected from light. Leaving the vials in the carton until the time of use is recommended. <sup>(1-8/07)</sup>

Idarubicin hydrochloride (Farmitalia) 0.07 mg/mL diluted in sodium chloride 0.9% and stored at 22 °C did not exhibit an antimicrobial effect on the growth of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. Viability was maintained for periods of 48 to 120 hours. The author recommended that diluted solutions of idarubicin hydrochloride be stored under refrigeration whenever possible and that the potential for microbiological growth should be considered when assigning expiration periods. <sup>(2160)</sup>

*pH Effects* — Idarubicin hydrochloride in prolonged contact with alkaline solutions will undergo decomposition. <sup>(1-8/07) (1368)</sup>

*Light Effects* — Dilute solutions (0.01 mg/mL) of idarubicin hydrochloride are light sensitive, undergoing some degradation with exposure to light over periods greater than six hours. <sup>(1368)</sup> However, the manufacturer indicates that no special precautions are necessary to protect freshly prepared solutions for administration. <sup>(1369)</sup>

*Sorption* — Idarubicin hydrochloride is compatible with PVC, glass, and polypropylene. <sup>(1369)</sup>

Idarubicin Hydrochloride - AHFS 10:00

## Ifosfamide - AHFS 10:00

**Products** — Ifosfamide is available in vials containing 1 or 3 g of drug. Reconstitute the ifosfamide with 20 or 60 mL of sterile water for injection or bacteriostatic water for injection (parabens or benzyl alcohol), respectively, to yield a 50-mg/mL solution. <sup>(1-7/07)</sup>

*pH* — Approximately 6. <sup>(72)</sup>

*Trade Name(s)* — Ifex

**Administration** — Ifosfamide is administered by slow intravenous infusion over a minimum of 30 minutes diluted to a concentration between 0.6 and 20 mg/mL. <sup>(1-7/07)</sup> <sup>(4)</sup> Ifosfamide has also been administered by continuous intravenous infusion. <sup>(4)</sup> To prevent bladder toxicity, mesna and at least 2 L/day of fluid should be given. <sup>(1-7/07)</sup> <sup>(4)</sup>

**Stability** — Intact vials of ifosfamide should be stored at controlled room temperature and protected from temperatures above 30 °C. <sup>(1-7/07)</sup> Ifosfamide may liquify at temperatures above 35 °C. <sup>(72)</sup>

The reconstituted solution is stated to be chemically and physically stable for seven days at 30 °C and for up to six weeks under refrigeration. <sup>(4)</sup> <sup>(72)</sup> Because of microbiological concerns, the manufacturer recommends storage under refrigeration and use in 24 hours for reconstituted or diluted ifosfamide solutions. <sup>(1-7/07)</sup>

Ifosfamide (Boehringer-Ingelheim) 80 mg/mL in sodium chloride 0.9% exhibited about 7% loss in nine days at 37 °C in the dark. <sup>(1494)</sup>

Reconstitution to an ifosfamide concentration of 100 mg/mL with benzyl alcohol-preserved bacteriostatic water for injection resulted in a turbid mixture, separating into two distinct liquid phases. The separate phases dissolved completely, with no loss of drug or preservative, when diluted to about 60 mg/mL or less. <sup>(1289)</sup>

*pH Effects* — Ifosfamide exhibits maximum solution stability in the pH range of 4 to 10; the rate of decomposition is essentially the same over this pH range. At pH values less than 4 and above 10, increased rates of decomposition have been observed. <sup>(2002)</sup> <sup>(2401)</sup>

*Syringes* — Ifosfamide 0.6 and 20 mg/mL in dextrose 5%, lactated Ringer's injection, sodium chloride 0.9%, and sterile water for injection in polypropylene syringes (Becton Dickinson) is physically and chemically stable for at least 24 hours at 30 °C. <sup>(1496)</sup>

*Ambulatory Pumps* — Ifosfamide (Asta Medica) 20 mg/mL and mesna (Asta Medica) 20 mg/mL in water for injection were evaluated for stability and compatibility in PVC reservoirs for Graseby 9000 ambulatory pumps. The solutions were physically compatible and analysis found about 3% ifosfamide and 9% mesna loss in 7 days at 37 °C. About 2% or less loss of both drugs was found after 14 days at 4 °C. Furthermore, weight losses due to moisture loss were minimal. <sup>(2288)</sup>

### Compatibility Information

#### Solution Compatibility

##### Ifosfamide

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in Ringer's injection			600 mg and 16 g	Physically compatible. Under 5% loss in 7 days at 30 °C and no loss in 6 weeks at 5 °C	72	C

Dextrose 5% in sodium chloride 0.9%	<a href="#">b</a>	0.6 to 20 g	Physically compatible and stable for 7 days at 30 °C and 6 weeks at 5 °C	<a href="#">4</a>	C
Dextrose 5% in sodium chloride 0.9%		600 mg and 16 g	Physically compatible. Under 5% loss in 7 days at 30 °C and no loss in 6 weeks at 5 °C	<a href="#">72</a>	C
Dextrose 5%	<a href="#">b</a>	0.6 to 20 g	Physically compatible and stable for 7 days at 30 °C and 6 weeks at 5 °C	<a href="#">4</a>	C
Dextrose 5%		600 mg and 16 g	Physically compatible. Under 5% loss in 7 days at 30 °C and no loss in 6 weeks at 5 °C	<a href="#">72</a>	C
Ringer's injection, lactated	<a href="#">b</a>	0.6 to 20 g	Physically compatible and stable for 7 days at 30 °C and 6 weeks at 5 °C	<a href="#">4</a>	C
Ringer's injection, lactated		600 mg and 16 g	Physically compatible. Under 5% loss in 7 days at 30 °C and no loss in 6 weeks at 5 °C	<a href="#">72</a>	C
Sodium chloride 0.45%		600 mg and 16 g	Physically compatible. Under 5% loss in 7 days at 30 °C and no loss in 6 weeks at 5 °C	<a href="#">72</a>	C
Sodium chloride 0.9%	<a href="#">b</a>	0.6 to 20 g	Physically compatible and stable for 7 days at 30 °C and 6 weeks at 5 °C	<a href="#">4</a>	C
Sodium chloride 0.9%		600 mg and 16 g	Physically compatible. Under 5% loss in 7 days at 30 °C and no loss in 6 weeks at 5 °C	<a href="#">72</a>	C
Sodium chloride 0.9%		BI 80 g	7% loss in 9 days at 37 °C in dark	<a href="#">1494</a>	C
Sodium chloride 0.9%	<a href="#">a</a>	10 g	No loss in 8 days at 4 and 25 °C protected from light and at 25 °C in light	<a href="#">1551</a>	C
Sodium chloride 0.9%	<a href="#">a</a>	20, 40, 80 g	No loss in 8 days at 35 °C	<a href="#">1551</a>	C
Sodium lactate (1/6) M		600 mg and 16 g	Physically compatible. Under 5% loss in 7 days at 30 °C and no loss in 6 weeks at 5 °C	<a href="#">72</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in glass, PVC, and polyolefin containers.

### Additive Compatibility

## Imipenem-Cilastatin Sodium - AHFS 8:12.07.08

**Products** — Imipenem-cilastatin sodium for intravenous use is available as a fixed combination of equal quantities of both drugs. The combination is provided in vials and infusion bottles containing 250 and 500 mg of each drug with sodium bicarbonate 10 and 20 mg, respectively. <sup>(1-8/06)</sup> (4)

The vials should be reconstituted with about 10 mL of a compatible diluent from a 100-mL infusion container and shaken well to form a suspension. Diluents containing benzyl alcohol should not be used to reconstitute the drug for use in neonates and small pediatric patients. The suspension must be transferred to the remaining solution in the infusion container for dilution. The suspension is *not* for direct injection. The procedure is then repeated: a 10-mL aliquot from the admixture is added to the vial and, once again, returned to the infusion admixture. This procedure ensures that all of the vial contents are transferred. The admixture should be agitated until it is clear to yield either a 2.5- or 5-mg/mL concentration, depending on the vial content. The admixture should *not* be heated to aid dissolution. <sup>(1-8/06)</sup> (4)

ADD-Vantage vials of imipenem-cilastatin sodium should be prepared with 100 mL of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags. <sup>(1-8/06)</sup> (4)

The 250- and 500-mg piggyback infusion bottles should be reconstituted with 100 mL of compatible diluent and shaken until clear to yield 2.5- and 5-mg/mL concentrations, respectively. <sup>(1-8/06)</sup> (4)

Imipenem-cilastatin sodium for intramuscular use is available in vials containing 500 or 750 mg of each component. The vials should be reconstituted with 2 or 3 mL, respectively, of lidocaine hydrochloride 1% (without epinephrine) and agitated to form a suspension. This intramuscular formulation is not for intravenous use. <sup>(1-8/06)</sup> (4)

*pH* — The intravenous product is buffered to pH 6.5 to 8.5. <sup>(1-8/06)</sup>

*Osmolarity* — When reconstituted and diluted as directed by the manufacturer, the osmolarity of the intravenous admixture approximates that of the diluent. <sup>(4)</sup>

*Sodium Content* — The 250- and 500-mg intravenous vials contain 0.8 mEq (18.8 mg) and 1.6 mEq (37.5 mg) of sodium, respectively. The 500- and 750-mg intramuscular vials contain 1.4 mEq (32 mg) and 2.1 mEq (48 mg) of sodium, respectively. <sup>(1-8/06)</sup> (4)

*Trade Name(s)* — Primaxin I.V., Primaxin I.M.

**Administration** — Imipenem-cilastatin sodium for intravenous use is given by intermittent intravenous infusion at a concentration not exceeding 5 mg/mL. Infusion periods vary from 20 to 60 minutes, depending on the dose. The intramuscular formulation should be injected deeply into a large muscle mass. Suspensions of either formulation should not be given intravenously. <sup>(1-8/06)</sup> (4)

**Stability** — The product should be stored below 25 °C. <sup>(1-8/06)</sup> (4)

Reconstituted as directed, intravenous solutions are colorless to yellow but may become a deeper yellow over time. Intramuscular suspensions are white to light tan. The manufacturer indicates that stability is not affected by color variations within this range <sup>(1-8/06)</sup>, but the solutions should be discarded if they darken to brown. <sup>(4)</sup> Intramuscular suspensions prepared with lidocaine hydrochloride (without epinephrine) should be used within one hour. <sup>(1-8/06)</sup> (4)

In solution, imipenem is substantially less stable than cilastatin and is the determining factor in the overall stability of the combination product. Reconstitution results in solutions that are stable for four hours at room temperature or 24 hours under refrigeration at 4 °C. <sup>(1-8/06)</sup>

Imipenem degradation kinetics were determined for a 2.5-mg/mL solution in sodium chloride 0.9%. The degradation rates were temperature dependent, with a half-life of over 44 hours at 2 °C dropping to six hours at 25 °C and to two hours at 37 °C. The decomposition was consistent with hydrolysis, and the loss of antimicrobial activity suggests cleavage of the β-lactam ring.<sup>(1272)</sup>

*pH Effects* — Imipenem is inactivated at acidic or alkaline pH but is more stable at neutral pH.<sup>(4)</sup> The pH range of maximum stability appears to be 6.5 to 7.5, with increasing rates of decomposition occurring as the pH moves away from this range.<sup>(1273)</sup> At a pH of about 4, the half-life of imipenem is about 35 minutes.<sup>(2166)</sup>

*Freezing Solutions* — The manufacturer recommends that imipenem-cilastatin solutions not be frozen.<sup>(1-8/06)</sup> At concentrations of 250 and 500 mg/100 mL in sodium chloride 0.9%, imipenem losses of around 15% occurred in one week when frozen at -20 and -10 °C.<sup>(1141)</sup> Freezing solutions at temperatures above -70 °C offers no stability advantage over refrigerated storage<sup>(1141)</sup> and results in decomposition of imipenem in a manner similar to ampicillin.<sup>(4)</sup>

*Effects of Solution Components* — Dextrose exerts an adverse effect on the stability of imipenem. Dextrose 5 and 10% reduced the time to 10% decomposition by about one-half compared to sterile water. Sodium chloride content increases imipenem stability because of a positive kinetic salt effect similar to other β-lactam antibiotics. Both lactate and bicarbonate anions attack the β-lactam ring and decrease imipenem stability.<sup>(1141)</sup>

*Elastomeric Reservoir Pumps* — Imipenem-cilastatin sodium (Merck) 5 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). Less than 1% binding was found after storage for two weeks at 35 °C with gentle agitation.<sup>(2014)</sup>

*Central Venous Catheter* — Imipenem-cilastatin (MSD) 2 mg/mL in sodium chloride 0.9% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Imipenem-cilastatin sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in Ringer's injection, lactated	AB <sup>a</sup>	MSD	2.5 g	8% imipenem loss in 3 hr, 15% in 6 hr at 25 °C. 9% loss in 24 hr, 15% in 48 hr at 4 °C	1141	I

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in dextrose 5% with albumin human 2 mg/mL.

<sup>e</sup>Lyophilized formulation tested.

<sup>f</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>g</sup>Injected via Y-site into an administration set running azithromycin.

---

Imipenem-Cilastatin Sodium - AHFS 8:12.07.08

## Immune Globulin Intravenous - AHFS 80:04

**Products** — Immune globulin intravenous is available from a number of manufacturers in both liquid and dry powder forms. Protein concentrations of 5 and 10% are available in liquid forms. Dry powder product sizes vary by product but range from 1 to 12 g of protein. The dry powder products require reconstitution in the volumes specified by the manufacturers for the individual sizes and typically result in protein concentrations of 5 or 10%.

Do not shake the reconstituted product. Rotate or swirl the vial to dissolve particles.<sup>(4)</sup> Foaming results from shaking and should be avoided<sup>(1)</sup> because it may impede dissolution.<sup>(1499)</sup>

Reconstitution of Sandoglobulin with dextrose 5% has resulted in extended dissolution times of 75 and 135 minutes for the 3 and 6% solutions, respectively. With sodium chloride 0.9%, dissolution occurs over a few minutes; exceptional cases take up to 20 minutes.<sup>(1498)</sup>

*pH* — The pH of the various immune globulin products varies but is typically within the range of 5 to 7 for the dry powder products and within the range of 4 to 6 for the liquid forms.<sup>(1)</sup> <sup>(4)</sup>

*Trade Name(s)* — Carimune NF, Flebogamma, Gamimune N, Gammagard S/D, Gammar-P IV, Gamunex, Iveegam EN, Octagam, Panglobulin, Polygam S/D, Sandoglobulin, Venoglobulin-S

**Administration** — Immune globulin intravenous is administered initially by slow intravenous infusion; the rate is gradually increased after 15 to 30 minutes according to patient tolerance.<sup>(1)</sup> <sup>(4)</sup>

**Stability** — Recommended storage conditions vary among the different immune globulin products. Typically the products are stored either at room temperature or under refrigeration with protection from freezing. The proper storage conditions for each specific product should be verified as it is received. Solutions that have been frozen should not be used.<sup>(1)</sup> <sup>(4)</sup>

Partially used immune globulin containers should be discarded.<sup>(4)</sup>

Immune globulin intravenous (Gammagard S/D, Baxter and Polygam S/D, American Red Cross) was reconstituted with sterile water for injection to concentrations of 50 mg/mL (5%) and 100 mg/mL (10%). Stability of the reconstituted product was evaluated in the original glass vials and also after transfer to PVC bags at 4 °C for 48 hours and at 25 °C for 12 hours. The visual appearance of the solutions remained acceptable, extremely low amounts of diethylhexyl phthalate (DEHP) plasticizer were leached from the PVC bags, and all tests for protein content and antibody activity indicated that stability was maintained throughout the study under both storage conditions.<sup>(2435)</sup>

*Sorption* — A stability evaluation of immune globulin intravenous in PVC bags found no loss of activity due to sorption when compared to glass containers.<sup>(2435)</sup>

*Plasticizer Leaching* — Storage of reconstituted immune globulin intravenous in PVC containers for 48 hours at 4 °C and 12 hours at 25 °C resulted in very low amounts of leached DEHP plasticizer from undetectable amounts up to a maximum of 86 ng/mL.<sup>(2435)</sup>

<sup>a</sup>With albumin human 0.1%.

<sup>b</sup>Tested in sodium chloride 0.9%.

### **Additional Compatibility Information**

Immune globulin products may be manufactured using differing procedures and may exhibit differing compatibility characteristics. All manufacturers recommend not mixing other drugs with the immune globulin. In addition, different brands of immune globulin cannot be safely mixed because of possible aggregate formation. The manufacturers make the recommendations cited in Table 1 regarding compatibility with infusion solutions.<sup>(1)</sup> ([1135](#))

**Table 1. Immune Globulin Products: Compatibility with Infusion Solutions**

<b>Product</b>	<b>Remarks</b>
Carimune NF	May be reconstituted with sodium chloride 0.9%, dextrose 5%, or sterile water for injection.
Flebogamma	Mixing with infusion solutions is not recommended by the manufacturer.
Gamimune N	Incompatible with sodium chloride 0.9%. Dextrose 5% is recommended for dilution if needed.
Gammagard S/D	Packaged with sterile water for injection for use as a diluent. No other diluents or solutions are recommended.
Gammar-P	Reconstitute with sterile water for injection. May be administered sequentially with dextrose 5% or sodium chloride 0.9%.
Gamunex	May be diluted with dextrose 5%. Incompatible with sodium chloride 0.9%.
Iveegam EN	Reconstitute with sterile water for injection. May be diluted in dextrose 5% or sodium chloride 0.9%.
Panglobulin	May be reconstituted with sodium chloride 0.9%, dextrose 5%, or sterile water for injection.
Venoglobulin-S	May be administered sequentially or flushed with dextrose 5% or sodium chloride 0.9%. Do not add infusion solutions to the immune globulin container.

Immune Globulin Intravenous - AHFS 80:04

## Indomethacin Sodium Trihydrate - AHFS 28:08.04.92

**Products** — Indomethacin sodium trihydrate is supplied as a lyophilized product in vials containing the equivalent of 1 mg of indomethacin. Reconstitute with 1 or 2 mL of preservative-free sterile water for injection or sodium chloride 0.9% to yield a 1- or 0.5-mg/mL solution, respectively. <sup>(1-7/06)</sup>

*pH* — From 6 to 7.5. <sup>(4)</sup>

*Trade Name(s)* — Indocin I.V.

**Administration** — Indomethacin sodium trihydrate is usually administered by intravenous injection over 20 to 30 minutes, although dilution after reconstitution is not recommended. Extravasation should be avoided. <sup>(1-7/06)</sup> <sup>(4)</sup>

**Stability** — Indomethacin sodium trihydrate is supplied as a white to yellow powder. Color variations have no relationship to indomethacin content. The vials should be stored below 30 °C and protected from light. <sup>(1-7/06)</sup>

The manufacturer recommends discarding any unused solution because of the absence of an antibacterial preservative. <sup>(1-7/06)</sup> However, at 1 mg/mL in sodium chloride 0.9%, the drug is stated to be chemically stable for 16 days at room temperature. <sup>(4)</sup>

Solutions of indomethacin sodium trihydrate (Abbott and Fujisawa) diluted in sodium chloride 0.9% to a concentration of 0.1 mg/mL were evaluated for visual and chemical stability stored in the original vials. Little or no loss was found after storage for 10 days at 25 °C. <sup>(2105)</sup>

The stability of indomethacin sodium trihydrate (Merck Sharp & Dohme) 0.5 mg/mL reconstituted with sterile water for injection in the original vials and repackaged into 1-mL polypropylene syringes (Sherwood) was reported. The reconstituted solutions were stored at room temperature (about 23 °C) exposed to fluorescent light for 12 hours daily and under refrigeration (about 4 °C) in the dark. Little or no loss of indomethacin in the refrigerated solutions occurred after 14 days of storage. The solutions stored at room temperature exhibited 9% loss in 10 days. The solutions at both temperatures remained visually clear and colorless throughout the study. <sup>(2228)</sup>

*pH Effects* — Reconstitution of indomethacin sodium trihydrate with solutions having pH values below 6 may result in precipitation of free indomethacin. <sup>(1-7/06)</sup> <sup>(4)</sup>

Indomethacin Sodium Trihydrate - AHFS 28:08.04.92

## Insulin Lispro - AHFS 68:20.08

**Products** — Insulin lispro is available in vials, cartridges, and pens as a suspension containing in each milliliter insulin lispro 100 units with glycerin 16 mg, dibasic sodium phosphate 1.88 mg, metacresol 3.15 mg, zinc ion 0.0197 mg (as oxide), a trace of phenol, and sodium hydroxide and/or hydrochloric acid to adjust pH during manufacturing in water for injection. <sup>(1-9/07)</sup>

*pH* — From 7.0 to 7.8. <sup>(1-9/07)</sup>

*Trade Name(s)* — Humalog

**Administration** — Insulin lispro is an injectable suspension intended for subcutaneous injection including using some external insulin pumps. <sup>(1-9/07)</sup>

**Stability** — Intact vials of insulin lispro should be stored under refrigeration and protected from freezing, excessive heat, and light. <sup>(1-9/07)</sup> Although refrigerated storage is required, the manufacturer has stated the drug may be stored at room temperature for 28 days. Visually inspect insulin lispro before use. Discard if it is cloudy, contains a precipitate, has thickened, or is discolored. <sup>(1-9/07)</sup> (2745)

Insulin lispro diluted with Sterile Diluent for Humalog to 10 or 50 units/mL can be used for 28 days refrigerated and for 14 days at room temperatures up to 30 °C. If diluting insulin lispro, great care is essential to avoid concentration errors. Insulin lispro in a cartridge or used in an external insulin pump must not be diluted. <sup>(1-9/07)</sup>

Insulin lispro cartridges used in D-TRON and D-TRON Plus external pumps should be discarded after seven days and the cartridge adapters and external pump reservoir should be discarded every 48 hours. <sup>(1-9/07)</sup>

The physical and chemical stability of insulin lispro 100 units/mL in MiniMed507c, H-TRONplus, and D-TRON CSII insulin infusion devices stored at 37 °C and subjected to mechanical shaking at 100 strokes/min was evaluated over 7 days. The insulin lispro solution remained clear and free of aggregation and precipitation, and concentrations remained at 95%. <sup>(2638)</sup>

Insulin Lispro - AHFS 68:20.08

## Insulin - AHFS 68:20.08

**Products** — Regular insulin is available in 10-mL vials and 1.5-mL prefilled syringes and syringe cartridges at a concentration of 100 units/mL. Human insulin is produced using recombinant DNA technology. Regular concentrated insulin (Lilly) also is available in 20-mL vials containing 500 units/mL. Glycerin 1.4 to 1.8% and phenol or cresol 0.1 to 0.25% may also be present. <sup>(1-1/08)</sup> <sup>(4)</sup>

Several modified forms of insulin (Isophane, Lente, etc.) are available, each having a characteristic onset of action, time to peak effect, and duration of action. <sup>(4)</sup>

Adequately mixing these products is necessary prior to use, but vigorous shaking may entrain air bubbles that could interfere with accurate dosing. Gentle shaking of the vial combined with end-over-end inversion and rolling in the palms has been suggested. <sup>(2270)</sup>

*pH* — All regular insulin products have a neutral pH of approximately 7 to 7.8. <sup>(4)</sup> <sup>(261)</sup>

*Trade Name(s)* — Humulin R

**Administration** — Regular insulin is usually administered by subcutaneous injection into the thighs, arms, buttocks, or abdomen, with sites rotated. Syringes calibrated for the particular concentration of insulin to be given must be used. Regular insulin may also be administered intramuscularly or by intravenous infusion, usually diluted in sodium chloride 0.9%. Regular insulin is the only form of insulin that can be given intravenously. <sup>(4)</sup>

Care is required when adding insulin to infusion solutions, especially in flexible containers. Adding insulin to a plasma expander carrier solution hanging in the use position resulted in stratification, with the insulin floating to the top. Little insulin was delivered initially, and 87% of the insulin appeared in the last 28% of the solution. Repeated inversion and agitation of the container to effect thorough mixture eliminates this stratification, yielding an even distribution and a constant delivery concentration. <sup>(85)</sup>

Reuse of disposable insulin syringes has been suggested to reduce cost to patients. However, disposable insulin syringes are usually siliconized. Reuse of disposable plastic insulin syringes (Plastipak Microfine II, Becton Dickinson) has resulted in contamination of vials of insulin with silicone oil, causing a white precipitate and impairment of biological effects. In a test of insulin from several sources, repeated drawing of the insulin into the disposable syringes and then expulsion of it back into the vials introduced substantial amounts of silicone oil; a white precipitate formed within 12 hours at 8 °C. <sup>(1110)</sup>

**Stability** — Regular insulin should be stored under refrigeration and protected from freezing. <sup>(1-1/08)</sup> <sup>(4)</sup> Although refrigerated storage is required, some manufacturers have stated the drug may be stored at room temperature for 28 to 30 days. <sup>(2745)</sup> <sup>(2769)</sup> Freezing of insulin products may alter the protein structure, decreasing concentration. <sup>(559)</sup> In one study of several insulin products, one cycle of freezing for 45 hours followed by slow thawing at 21 °C or rapid thawing in a water bath at 37 °C did not result in a loss of bioactivity. However, microscopic examination revealed particle aggregation, and some crystal damage had occurred. <sup>(680)</sup>

The stability of regular insulin (Novo Nordisk) was evaluated under simulated shipping conditions. Sample vials were packaged in both insulated and non-insulated mailers and packaged with either two 12-oz. frozen gel packs for simulated summer mailing or one 12-oz. frozen gel pack for simulated winter shipping. The evaluation was conducted for simulated transit periods ranging from 24 hours to 120 hours (overnight air delivery to ground delivery). Visual inspection found no change in appearance in any of the samples tested. Microscopy found no formation of aggregates. No loss of insulin content occurred in any of the samples with any of the shipping methods and conditions. Size exclusion chromatography found little or no change in high-molecular-weight protein content. The regular insulin remained within USP specifications with all of the shipping methods and time periods

studied.<sup>(2769)</sup>

As with other protein and peptide products, insulin aggregation with possible reduced bioactivity can be a problem. Aggregates have been found to form in a variety of infusion devices and under various storage conditions, including static storage and continuous rotational or reciprocating motion.<sup>(1948)</sup><sup>(1995)</sup> <sup>(2406)</sup> Aggregation may occur at air-water interfaces. Such interfaces have been generated by turbulence, such as shaking and repeatedly passing insulin through a syringe and needle. With sufficient vigor, both actions can turn the insulin turbid from insoluble aggregates.<sup>(1948)</sup> In addition, contact with silicone rubber appears to promote insulin aggregation.<sup>(1995)</sup>

Factors that increase the formation rate of insulin transformation products (such as deamidated insulin, covalent dimers, and higher oligomers) in beef and human insulin products were evaluated during six months of storage. A low rate of transformation product appeared at 4 °C. Higher temperatures, as might occur when insulin is carried in a shirt pocket or car glove compartment, accelerated this production (especially for human insulin) and also fibril formation. Exposure to light increased the dimer and higher oligomer content. Insulin should not be exposed to direct sunlight or subjected to vibration or extremes of temperature.<sup>(1663)</sup>

The appearance of transformation products was found to be two- to three-fold greater when using PVC administration sets compared to polyethylene and polypropylene infusion equipment. Furthermore, use of the PVC sets resulted in up to 30% reduction in the concentration of methylparaben, phenol, and m-cresol preservatives in insulin products.<sup>(311)</sup>

Regular insulin, containing 100 units/mL, is clear and colorless or almost colorless. The concentrated injection containing 500 units/mL may be straw colored. Discoloration, turbidity, or unusual viscosity indicates deterioration or contamination.<sup>(4)</sup>

Insulin 4, 10, 20, and 40 units/L was evaluated in the following Baxter peritoneal dialysis solutions in PVC and Clear-Flex polyolefin containers:

- Dianeal PD4 with 1.36% dextrose in PVC containers
- Physioneal 40 with 1.36% dextrose in PVC containers
- Physioneal 40 Clear-Flex with 1.36% dextrose in Clear-Flex

In Dianeal PD4, more than 90% of the insulin concentration remained over 24 hours. The insulin 10, 20, and 40 units/L in Physioneal 40 retained more than 90% of the insulin concentration over six hours and more than 80% over 24 hours. The insulin 4 units/L in Physioneal 40 retained more than 90% of the insulin concentration over three hours and more than 70% over 24 hours. No difference was found between the results in PVC and Clear-Flex containers.<sup>(2647)</sup>

*Syringes* — It has been stated that neutral regular insulin (and also NPH and Lente insulin) can be stored for five to seven days under refrigeration in either glass or plastic syringes. Mixtures of these insulins can also be stored similarly.<sup>(679)</sup>

Insulin soluble, BP, 1.6 units/2 mL diluted in sodium chloride 0.9% was stored for 18 hours at room temperature in the following plastic syringes: Brunswick (Sherwood Medical), Plastipak (Becton Dickinson), and Sabre (Gillette U.K.). The first two syringes have polypropylene barrels; the Sabre has a combination polypropylene-polystyrene barrel. No significant loss of insulin occurred due to sorption. Significant (but unspecified) losses did occur when the concentration was reduced to 0.2 unit/mL, but the make of syringe did not influence this adsorption.<sup>(784)</sup>

No apparent degradation or binding occurred for at least 14 days when insulin, USP (Lilly), 100 units/mL was stored under refrigeration in 1-mL polypropylene syringes (Becton Dickinson).<sup>(805)</sup>

The soluble insulins Velosulin (Nordisk), Actrapid and Human Actrapid (Novo), Humulin S (Lilly),

Neusulin (Wellcome), and Quicksol (Boots) in 1-mL 100-unit Plastipak syringes (Becton Dickinson) exhibited no loss in 29 days when stored at 4 and 20 °C.<sup>(1275)</sup>

Regular insulin human (Humulin R, 100 units/mL, Lilly), isophane insulin human (Humulin N, 100 units/mL, Lilly), and the combination product (Humulin N/R 70/30, Lilly) were evaluated for stability packaged in plastic syringes. Test samples of 0.4 mL of each insulin product were drawn into 1-mL polypropylene syringes (Plastipak, Becton Dickinson) and 1-mL polypropylene-ethylene copolymer syringes (Terumo) and stored for 28 days at 4 and 23 °C. No loss of insulin from any insulin product occurred in either syringe type. However, the antibacterial preservatives present in the insulin formulations were lost, especially in the polypropylene syringes at room temperature. Storage under refrigeration to slow the loss of preservative as much as possible was recommended.<sup>(1124)</sup>

*Infusion Pumps* — Insulin solutions may form highly insoluble polymers. In areas having high shear rates such as the tubing, cannula, and needle, aggregation can lead to blockage. In low shear areas such as the insulin reservoir of implantable pumps, gentle agitation can lead to the formation of a cross-linked gel.<sup>(1112)</sup>

*Sorption* — The adsorption of insulin to the surfaces of intravenous infusion solution containers, glass and plastic (including PVC, ethylene vinyl acetate, polyethylene, and other polyolefins), tubing, and filters has been demonstrated. Estimates of the loss range up to about 80% for the entire infusion apparatus, although varying results using differing test methods, equipment, and procedures have been reported. Estimates of adsorption of around 20 to 30% are common. The percent adsorbed is inversely proportional to the concentration of insulin. Other important factors are the amount of container surface area and the fill volume of the solution. The amount of insulin adsorbed varies directly with the available surface area and indirectly with the ratio of fluid volume to container capacity. The container material is a factor, with glass possibly adsorbing insulin more extensively than some plastics. Other factors influencing the extent of insulin adsorption include the type of solution, type and length of administration set, rate of infusion, temperature, previous exposure of tubing to insulin, and presence of albumin human, whole blood, electrolytes, and other drugs.<sup>(266) (267) (268) (269) (420) (422) (423) (424) (425) (426) (428) (533) (681) (682) (683) (684) (685) (686) (687) (688) (689) (690) (854) (908) (909) (910) (911) (912) (913) (1111) (1112) (1274) (1282) (1408) (1497) (1664) (1665) (2079) (2301)</sup>

The adsorption of insulin to container surfaces is an instantaneous process.<sup>(267) (425) (911) (912) (913)</sup> However, the effect of adsorption on the deliverable amount of insulin appears to vary with time. Several investigators reported a dramatic initial drop in delivered insulin followed by a return to higher (although variable) levels. The bulk of the insulin adsorption apparently occurs in the first 30 to 60 minutes. Although flow rate does not influence total insulin binding, the plateau phase of delivered insulin may be reached more quickly at faster infusion rates.<sup>(422) (424) (425) (426) (428) (687) (688) (689) (854) (2301)</sup>

In a study of insulin loss during simulated delivery to low-birth-weight infants, insulin 0.2 unit/mL was delivered at rates of 0.05 and 0.2 mL/hr through microbore PVC tubing and polyethylene-lined PVC tubing. During the early hours, the amount of insulin delivered through both types of tubing was much reduced, especially at the slower delivery rate. The authors indicated that this loss might contribute to the 14- to 24-hour delays in blood glucose normalization in these infants. The priming of microbore tubing with 5 units/mL of insulin for 20 minutes was suggested to accelerate the achievement of steady-state insulin delivery. The time courses of insulin delivery observed for representative unprimed and primed sets are presented in Table 1.<sup>(2301)</sup>

Regular human insulin 0.1 unit/mL in sodium chloride 0.9% in VISIV polyolefin bags was tested for 24 hours at room temperature near 23 °C. About 35% loss occurred, which is consistent with the drug's potential for adsorption to surfaces.<sup>(2660) (2792)</sup>

**Table 1. Approximate Amount of Insulin Delivered through Unprimed and Primed<sup>a</sup> Administration Sets<sup>2301</sup>**

**Delivered Insulin (%)**

Set Type	1 hr	2 hr	4 hr	8 hr	24 hr
Unprimed	17	11	27	55	100
Primed	70	70	70	100	100

<sup>a</sup>Primed with insulin 5 units/mL for 20 minutes.

The addition of albumin human to infusion solutions helps to reduce the adsorption of insulin. The degree to which albumin human prevents adsorption is uncertain. Reported losses of insulin in albumin-containing solutions have varied from about zero to approximately 30%. However, most work indicates a substantial reduction in insulin adsorption.<sup>(266) (267) (268) (269) (418) (428) (683) (684) (685) (908) (909)</sup> Other additives such as vitamins, electrolytes, and drugs may also have a similar effect.<sup>(425) (909) (914)</sup>

Other recommended approaches to avoiding or minimizing adsorption include adding a small amount of the patient's blood to the insulin solution<sup>(689) (690) (691)</sup> and storing or flushing the administration apparatus with the insulin solution to saturate the set prior to administration.<sup>(428) (1111) (2301)</sup> Addition of extra insulin to compensate for the losses has also been suggested.<sup>(1112)</sup> As an alternative, administration of insulin using a syringe pump with a short cannula has been recommended. This procedure will reduce the surface area in relation to the amount of insulin present.<sup>(1033)</sup>

The clinical significance of this adsorption is uncertain. Some clinical studies indicated no relevant effect on the success of therapy.<sup>(415) (427) (685)</sup> Some investigators felt that the importance of insulin adsorption to the surfaces of the infusion container and tubing may be a moot point since the dosage is individualized on the basis of blood and urine glucose determinations. Simply adding more insulin may saturate binding sites and yield the desired response.<sup>(270) (271) (854) (909)</sup>

Still others indicated that the adsorption may indeed be relevant for solutions with an insulin content of less than 100 or 200 units/L.<sup>(424) (426) (428) (908) (2301)</sup>

If the apparent dose of intravenous insulin is used as the basis for determining the subsequent dose upon discontinuing the intravenous one, then a potential for dosing error exists. The actual amount of insulin being administered could be substantially less than the apparent amount.<sup>(533)</sup>

Whether one attempts to prevent insulin adsorption or not, it does not appear to be possible to add an amount of insulin to an infusion solution and know precisely what portion of that amount will actually be given to the patient. Monitoring the patient's response to therapy and making the appropriate adjustments on the basis of that response are, therefore, of prime importance.<sup>(690) (854) (1664)</sup>

*Implantable Pumps* — Insulin, regular human (Genapol, Hoeschst-Roussel) 400 units/mL with heparin sodium 500 units/mL was evaluated in MIP 2001 implantable pumps (MiniMed) at 37 °C for three months. The drug solution remained visually clear, but the insulin content dropped to 65% of the initial amount. The activity of heparin declined by even more. Only 45% remained after three months. The losses were attributed to the shaking that occurred during use rather than temperature, interaction with pump materials, or interaction of the two drugs with each other.<sup>(239)</sup>

*Filtration* — A filter material specially treated with a proprietary agent was evaluated for a reduction in insulin binding. Insulin, regular (Lilly), 40 units/L in dextrose 5% and sodium chloride 0.9% was run through an administration set with a treated 0.22- $\mu$ m cellulose ester inline filter at a rate of 2 mL/min. Cumulative insulin losses from the first 150 mL of solution were about 12% from dextrose 5% and 4% from sodium chloride 0.9%, compared to much higher losses previously reported for untreated cellulose ester filter material. Furthermore, equilibrium binding studies showed a reduction to 5% of the binding to untreated filter material from either solution.<sup>(904)</sup> All Abbott Ixev integral filter and extension sets currently use this treated filter material.<sup>(1074)</sup>

## Compatibility Information

### Solution Compatibility

#### Insulin, regular

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Sodium chloride 0.9%	HOS <sup>b</sup>	NOV	100 units	35 to 45% loss in 24 hr due to adsorption	<a href="#">2660</a> <a href="#">2792</a>	?
Sodium chloride 0.9%	BA <sup>a</sup>	LI	1000 units	10% loss in 1 hr in 50-mL bag and in 4 hr in 250-mL bag	<a href="#">2079</a>	I
TNA #267 <sup>c</sup>	<sup>d</sup>	NOV	10 units	40 to 60% loss likely due to sorption	<a href="#">2599</a>	I

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in VISIV polyolefin containers.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>d</sup>Tested in EVA containers.

### Additive Compatibility

#### Insulin, regular

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Cytarabine	UP	100 and 500 mg		40 units	D5W	Fine precipitate forms	<a href="#">174</a>	I
Meropenem	ZEN	1 and 20 g	LI	1000 units	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup>Tested in sodium chloride 0.45%.

<sup>e</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>f</sup>Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>g</sup>Tested in Ringer's injection, lactated.

<sup>h</sup>Tested in sterile water for injection.

<sup>i</sup>Tested in dextrose 5% in Ringer's injection, lactated.

<sup>j</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>k</sup>Tested in Haemacel (Behring).

<sup>l</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

### **Additional Compatibility Information**

*Mixing Insulin Products* — Mixing of the various types of insulin has been utilized. The following compatibility results have been cited<sup>(1076)</sup> :

#### **Insulin Types**

Regular with NPH  
 Regular with protamine zinc  
 Regular with Lente

#### **Compatibility**

Mixtures are stable in all ratios  
 Stability is unpredictable  
 Reduces activity of regular due to binding to excess zinc

Lente, Semilente, Ultralente  
Lente, Semilente, Ultralente with phosphate-  
buffered insulins<sup>a</sup>

Mixtures are stable in all ratios  
Should not be mixed due to precipitation

---

<sup>a</sup>Includes Humulin BR, NPH, protamine zinc, Velosulin insulins.

It has been stated that neutral regular insulin may be combined with modified insulin in any proportions.<sup>(263)</sup> <sup>(264)</sup> However, losses of soluble insulins when mixed with zinc and isophane insulins were reported. These losses generally ranged from about 20 to 50% but were as high as 99%, depending on the ratio and sources of the two insulins in the mixture. The reaction occurred within the first 90 to 120 seconds after mixing, with no further losses occurring after this time. This phenomenon could explain clinical reports of failure to control postprandial blood sugar levels.<sup>(1275)</sup>

The loss of solubility when short-acting insulins were mixed in ratios of 1:1, 1:2, 1:3, and 1:5 with long-acting insulins was reported. Iletin II Regular (Lilly) was mixed with Iletin II Lente, NPH, or Ultralente (Lilly). Actrapid (Novo) was mixed with Monotard (Novo). Velosulin (Nordisk) was mixed with Insulatard (Nordisk). The mixtures were centrifuged after storage times of approximately 20 minutes and 75 seconds. The level of soluble short-acting insulin in the supernatant was determined. In a 1:1 ratio, no significant loss of solubility occurred with the Iletin II Lente combination within 20 minutes and with the Actrapid-Monotard combination in 75 seconds. All other combinations, ratios, and time periods had losses ranging from 10 to 75%. The worst losses were experienced with the highest ratios of long-acting insulins and with the longer time period. The method used to prolong insulin action (precipitation) might affect the solubility of the short-acting insulin when admixed.<sup>(1156)</sup>

The loss of initial hypoglycemic effect when Actrapid HM (Novo) was mixed with Ultratard HM (Novo), an ultralente insulin, for five minutes before injection was noted. The authors recommended not mixing the two types of insulin to preserve the rapid hypoglycemic effect of regular insulin.<sup>(73)</sup>

*Octreotide* — Insulin levels in a 3-L bag of parenteral nutrition solution showed a marked reduction when octreotide 150 mcg was added to the container. Sample parenteral nutrition solutions, with and without octreotide, were prepared with regular insulin 15 units/3-L bag. Subsequent analysis found an insulin level of 3.5 units/L in the plain parenteral nutrition solution, an amount consistent with the losses occurring due to surface adsorption. However, in the parenteral nutrition solution containing octreotide, the insulin level was only 0.6 unit/L. The reason for this potential incompatibility is not known.<sup>(1377)</sup>

## Interferon Alfa-2b - AHFS 10:00

**Products** — Interferon alfa-2b is available as a dry powder in vials containing 10, 18, and 50 million International Units (I.U.) packaged with bacteriostatic water for injection containing benzyl alcohol 0.9% diluent. Only the 10-million I.U. vial is recommended for intralesional use. The 50-million I.U. vials are used in malignant melanoma and AIDS-related Kaposi's sarcoma only. <sup>(1-5/08)</sup>

For intramuscular, subcutaneous, or intralesional use, reconstitute the appropriate-size vial contents with the bacteriostatic water for injection diluent using the requisite volume noted in Table 1. Direct the stream at the vial wall and not at the powder in the bottom of the vial. Swirl gently to dissolve the powder; do not shake. <sup>(1-5/08)</sup>

In addition to the drug, the reconstituted solutions also contain in each milliliter glycine 20 mg, sodium phosphate dibasic 2.3 mg, sodium phosphate monobasic 0.55 mg, and albumin human 1 mg. <sup>(1-5/08)</sup>

For intravenous infusion, reconstitute the appropriate-size vial contents with the diluent provided. Swirl gently to dissolve the powder; do not shake. Withdraw the appropriate dose and add it to 100 mL of sodium chloride 0.9%, ensuring that the final concentration is not less than 10 million I.U./100 mL. <sup>(1-5/08)</sup>

**Table 1. Reconstitution of Interferon Alfa-2b Powder for Injection Vials** <sup>1-5/08</sup>

Vial Size (million I.U.)	Diluent Volume (mL)	Concentration (I.U./mL)
10	2	5
10	1	10 (for intralesional use only)
18	1	18
50	1	50 (for malignant melanoma and AIDS-related Kaposi's sarcoma only)

Interferon alfa-2b is also available for intramuscular or subcutaneous use as solutions in multidose vials, which contain 22.8 million I.U./3.8 mL (6 million I.U./mL), and 25 million I.U., which contain 32 million I.U./3.2 mL (10 million I.U./mL). Multidose injection "pens" are also available containing 3, 5, and 10 million I.U. per 0.2 mL injection with a total of 1.5 mL per pen for subcutaneous injection. <sup>(1-5/08)</sup>

Each milliliter of solution also contains sodium chloride 7.5 mg, sodium phosphate dibasic 1.8 mg, sodium phosphate monobasic 1.3 mg, edetate disodium 0.1 mg, polysorbate 80 0.1 mg, and metacresol 1.5 mg. The solution products are albumin-free. <sup>(1-5/08)</sup>

Vial size to be used and appropriate concentration are dependent on the intended use of the product. In addition to intramuscular and subcutaneous use, the 10-million I.U. vials are also for intralesional use. Interferon alfa-2b solution products are not recommended for intravenous administration in the United States labeling. <sup>(1-5/08)</sup>

In the Canadian labeling, intravenous infusion of the solution products is permitted with dilution in sodium chloride 0.9% immediately before administration to a concentration no lower than 0.3 million I.U./mL. These albumin-free dosage forms require this higher minimum concentration to avoid loss due to sorption to plastic bags. <sup>(1-5/08)</sup>

*Specific Activity* — Approximately  $2 \times 10^8$  I.U./mg of protein. <sup>(1-5/08)</sup>

*pH* — The reconstituted powder for injection has a pH in the range of 6.9 to 7.5. <sup>(4)</sup>

**Tonicity** — Reconstitution of the 10-million I.U. vial with 1 mL of water for injection results in an isotonic solution. <sup>(1369)</sup>

**Trade Name(s)** — Intron A

**Administration** — The administration of interferon alfa-2b is dependent on the intended use and specific dosage form. The dry powder products, reconstituted as directed, may be administered by intramuscular and subcutaneous injection or intravenous infusion. The contents of the 10-million I.U. vial, reconstituted as directed, may also be given intralesionally. For intravenous infusions, interferon alfa-2b may be diluted further to a concentration of not less than 10 million I.U./100 mL of sodium chloride 0.9% for intravenous infusion over 20 minutes. <sup>(1-5/08)</sup>

The solution products are administered by intramuscular or subcutaneous injection. The 5-million I.U. and 10-million I.U. vials and the 25-million I.U. multidose vials may also be used for intralesional injection. The solution products are not for use in malignant melanoma or AIDS-related Kaposi's sarcoma. In addition, the Canadian product labeling permits intravenous infusion in sodium chloride 0.9% at concentrations no lower than 0.3 million units/mL. <sup>(1-5/08)</sup>

**Stability** — Interferon alfa-2b dry powder in vials is a white to cream color. <sup>(1-5/08)</sup> <sup>(4)</sup> It is not photosensitive. <sup>(1369)</sup> The reconstituted solution is clear and colorless to light yellow. Intact vials should be stored under refrigeration at 2 to 8 °C but are stable up to seven days at 45 °C <sup>(4)</sup> or 28 days at room temperature. <sup>(1369)</sup> The reconstituted solution should be stored under refrigeration. In concentrations between 3 and 50 million I.U./mL, reconstituted solutions are stable for up to one month under refrigeration and up to two days at ambient temperatures up to 40 °C. <sup>(1-5/08)</sup>

Interferon alfa-2b solution in vials is colorless. Intact vials of solution should be stored under refrigeration at 2 to 8 °C. The solution products are stable for up to seven days at 35 °C and up to 14 days at 30 °C. Interferon alfa-2b in multidose pens is stable for up to two days at 30 °C. <sup>(1-5/08)</sup>

Interferon alfa-2b (Schering) containing albumin human in the formulation reconstituted with the accompanying diluent and diluted further to 2 million I.U./mL with sterile water for injection was stored at 4 °C for 21 days in polypropylene centrifuge tubes. Biological activity was retained throughout the study period. <sup>(2022)</sup>

In another study, the retention of bioactivity by albumin-free interferon alfa-2b 6 million units/mL stability was compared to samples of that product to which albumin human 1 mg/mL was added and also to the reconstituted product containing albumin human in the formulation. The solutions were packaged as 0.5 mL in polypropylene syringes and stored at 4 °C for 42 days. In addition, the albumin-free product was diluted to 2 million units/mL with sterile water for injection and stored in a 60-mL polypropylene syringe under the same conditions. No substantial loss of biological activity was found in any of the samples. <sup>(2188)</sup>

Sodium chloride 0.9% is recommended for preparation of intravenous infusion admixtures. <sup>(1-5/08)</sup>

Interferon alfa-2b is stated to be compatible with sodium chloride 0.9%, Ringer's injection, and Ringer's injection, lactated. It is stated to be incompatible with dextrose solutions. <sup>(1369)</sup>

**pH Effects** — Reconstituted interferon alfa-2b is stable over a pH range of 6.5 to 8 <sup>(4)</sup>, with greatest stability between pH 6.9 and 7.5. <sup>(1369)</sup>

**Freezing Solutions** — Reconstituted interferon alfa-2b 10 million I.U./mL packaged in plastic syringes is stated to be stable for up to four weeks when frozen at -10 °C or colder. <sup>(4)</sup> Solutions frozen at -20 °C are stated to be stable for 56 days including four freeze-thaw cycles. Frozen solutions stored at -80 °C are stable for one year. <sup>(1369)</sup>

*Syringes* — Interferon alfa-2b (Intron A, Kirby-Warwick) 3 million units was diluted in 6 mL of sterile water for injection and packaged in 10-mL polypropylene syringes. The samples were stored for 14 days under refrigeration and for 24 hours at 37 °C. Analysis found changes indicating interconversion between interferon monomers and possibly oligomer formation. Dilution and packaging in polypropylene syringes was considered to be unsuitable. <sup>(744)</sup>

*Sorption* — Like other interferons, interferon alfa-2b can bind to surfaces, including glass and plastics. Consequently, albumin human is incorporated into the dry powder dosage forms to minimize adsorption and permit the use of glass or plastic syringes for administration without substantial loss at concentrations not less than 0.1 million I.U./mL. <sup>(1-5/08)</sup> <sup>(4)</sup> The solution dosage forms are albumin-free. Consequently, the Canadian product labeling recommends dilution of the solution products in sodium chloride 0.9% to a concentration not lower than 0.3 million I.U./mL to prevent losses. <sup>(1-5/08)</sup>

Interferon Alfa-2b - AHFS 10:00

## Iodipamide Meglumine - AHFS 36:68

**Products** — Iodipamide meglumine is available in 20-mL vials containing an aqueous solution composed of 52% iodipamide meglumine (5.2 g bound iodine/20 mL) with 0.32% sodium citrate buffer and 0.04% edetate disodium. <sup>(1-7/06)</sup> (4)

*pH* — From 6.5 to 7.7. <sup>(1-7/06)</sup> (4)

*Sodium Content* — The 52% solution contains approximately 18.2 mg of sodium per 20 mL. <sup>(1-7/06)</sup>

*Trade Name(s)* — Cholografin Meglumine

**Administration** — Iodipamide meglumine is administered slowly intravenously only. After warming to body temperature, the 52% injection is injected over 10 minutes. <sup>(1-7/06)</sup> (4)

**Stability** — The solutions may vary from colorless to pale yellow or light amber. Darker solutions should not be used. Crystallization may occur in the 52% solution. To redissolve it, place the vial in hot water and shake gently for several minutes. If cloudiness does not disappear, the solution should not be used. <sup>(1-7/06)</sup> (4)

Plastic syringes have been stated to be unsuitable for accommodating radiopaque solutions for any length of time. The plastic is attacked, and the plunger tends to freeze on prolonged storage. <sup>(40)</sup> However, when iodipamide meglumine (Squibb) 52% was stored in polystyrene syringes (Pharmaseal) at 25 and 37 °C, no apparent changes were noted visually or spectrophotometrically over five days. <sup>(530)</sup>

Iodipamide meglumine solutions should be protected from light and excessive heat. <sup>(1-7/06)</sup>

### Compatibility Information

Iodipamide Meglumine - AHFS 36:68

## Iodixanol - AHFS 36:68

**Products** — Iodixanol is available at 270 mg/mL of organically bound iodine (as 550 mg/mL of iodixanol) with calcium chloride dihydrate 0.074 mg/mL and sodium chloride 1.87 mg/mL. It is also available at 320 mg/mL of organically bound iodine (as 652 mg/mL of iodixanol) with calcium chloride dihydrate 0.044 mg/mL and sodium chloride 1.11 mg/mL. Each milliliter of the solutions also contains tromethamine 1.2 mg, edetate calcium disodium 0.1 mg, and hydrochloric acid and/or sodium hydroxide to adjust pH. The products are packaged from 50 to 200 mL. <sup>(1-5/06)</sup>

**pH** — Adjusted during manufacturing to pH 7.4 with a range from 6.8 to 7.7 at 22 °C. <sup>(1-5/06)</sup>

**Osmolarity** — Both concentrations have an osmolality of 290 mOsm/kg. <sup>(1-5/06)</sup>

**Density** — The 270-mg I/mL product has a density of 1.314 g/mL at 20 °C and 1.303 g/mL at 37 °C. The 320-mg I/mL product has a density of 1.369 g/mL at 20 °C and 1.356 g/mL at 37 °C. <sup>(1-5/06)</sup>

**Trade Name(s)** — Vispaque

**Administration** — Iodixanol is administered intravenously and intra-arterially. It is not intended for intrathecal use. The drug may be administered at either body or room temperature. <sup>(1-5/06)</sup>

**Stability** — Intact containers of clear, colorless to pale yellow iodixanol injection should be stored at controlled room temperature and protected from exposure to direct sunlight and from freezing. Discard the product if inadvertently frozen because of possible damage to closure integrity. The foil overwrap on the flexible plastic containers serves as both a moisture and light barrier and should not be removed until immediately before use. Vials and bottles of iodixanol may be stored for up to one month at 37 °C in a contrast agent warmer using circulating warm air. <sup>(1-5/06)</sup>

Iodixanol - AHFS 36:68

## Iohexol - AHFS 36:68

**Products** — Iohexol is available in concentrations ranging from 30.2% (140 mg/mL organically bound iodine) to 75.5% (350 mg/mL organically bound iodine) in numerous vial and bottle sizes from 10 to 250 mL; not all concentrations are available in all sizes. Also present in each milliliter are tromethamine 1.21 mg, edetate calcium disodium 0.1 mg, and hydrochloric acid or sodium hydroxide to adjust the pH.<sup>(1-1/07)</sup> Table 1 presents the characteristics of iohexol products.

**Table 1. Iohexol Product Characteristics**<sup>1-1/07</sup>

Iohexol Concentration (%)	Iodine Concentration (mg/mL)	Osmolality (mOsm/kg)	Specific Gravity (37 °C)
30.2	140	322	1.164
38.8	180	408	1.209
51.8	240	520	1.280
64.7	300	672	1.349
75.5	350	844	1.406

*pH* — From 6.8 to 7.7.<sup>(1-1/07)</sup>

*Trade Name(s)* — Omnipaque

**Administration** — Iohexol at appropriate concentrations may be administered intravenously, intra-arterially, intrathecally (except for Omnipaque 350) slowly over one to two minutes, intra-articularly, or directly into selected areas for visualization. Solutions should be warmed to body temperature prior to administration.<sup>(1-1/07)</sup>

**Stability** — Iohexol is colorless to pale yellow. Intact vials should be stored at controlled room temperature and protected from direct exposure to sunlight and freezing. The product should not be used if particulate matter is present. Do not remove the iohexol containers from the moisture- and light-protective foil overwrap until immediately before use.<sup>(1-1/07)</sup>

## Iopamidol - AHFS 36:68

**Products** — Iopamidol products are available in concentrations ranging from 41% (200 mg/mL organically bound iodine) to 76% (370 mg/mL organically bound iodine) in numerous vial and bottle sizes from 20 to 200 mL; not all concentrations are available in all sizes. Also present in each milliliter are tromethamine 1 mg, edetate calcium disodium, with hydrochloric acid and/or sodium hydroxide to adjust the pH. <sup>(1-3/07)</sup> Table 1 presents the characteristics of iopamidol products.

**Table 1. Iopamidol Product Characteristics** <sup>1-3/07</sup>

Iopamidol Concentration (%)	Iodine Concentration (mg/mL)	Osmolality (mOsm/kg)	Specific Gravity (37 °C)
41	200	413	1.227
51	250	524	1.281
61	300	616	1.339
76	370	796	1.405

*pH* — From 6.5 to 7.5. <sup>(1-3/07)</sup>

*Trade Name(s)* — Isovue

**Administration** — Iopamidol may be administered intravenously or intra-arterially. Solutions should be warmed to body temperature prior to administration. <sup>(1-3/07)</sup>

**Stability** — Iopamidol injection is colorless to pale yellow. Intact vials should be stored at controlled room temperature and protected from light. If crystals form, they should be dissolved by warming of the vial in hot (60 to 100 °C) water for about five minutes and gentle shaking. The vials should cool to body temperature before use. If crystals fail to dissolve, the vials should be discarded. <sup>(1-3/07)</sup>

Iopamidol - AHFS 36:68

## Iothalamate Meglumine - AHFS 36:68

**Products** — Iothalamate meglumine is available in concentrations ranging from 17.2 to 60. The formulations may also contain edetate and phosphate buffers. Some examples of single-agent products are listed in Table 1.<sup>(1) (4)</sup>

**Table 1. Some Representative Iothalamate Meglumine Products**

Iothalamate Meglumine Content (%)	Bound Iodine (mg/mL)	Representative Trade Names
<b>Urogenital solutions (not for intravascular use)</b>		
17.2	81	Cysto-Conray II
<b>Parenteral solutions</b>		
30	141	Conray 30
43	202	Conray 43
60	282	Conray

*pH* — From 6.5 to 7.7.<sup>(1)</sup>

*Osmolarity* — The injections are hypertonic having osmolalities of 600 to 1400 mOsm/kg.<sup>(1)</sup>

**Administration** — Iothalamate meglumine solutions may be administered intravenously, intra-arterially, by injection into pancreatic and biliary ducts, and by bladder, ureter, or renal pelvis instillation. Solutions should be warmed to body temperature before administration.<sup>(4)</sup>

**Stability** — Iothalamate meglumine solutions are colorless to pale yellow. They should be stored below 30 °C. Crystallization does not occur at room temperature, but exposure to cold temperatures may result in crystallization. Should crystallization occur, the solution should be brought to room temperature, with shaking of the container if necessary to redissolve the crystals. The speed of dissolution may be increased by heating the vials in warm air.<sup>(1) (4)</sup>

*pH Effects* — Iothalamate meglumine is sensitive to low pH values. At pH values reported as about 2.4 to 2.7<sup>(479)</sup> and below 3<sup>(4)</sup>, turbidity or frank precipitation may appear in the 60% product.<sup>(479)</sup>

*Light Effects* — Iothalamate meglumine is light sensitive and should be protected from strong daylight and direct sunlight.<sup>(4)</sup>

*Syringes* — Iothalamate meglumine 60% (Conray) was stored in polystyrene syringes (Pharmaseal) at 25 and 37 °C. No apparent changes were noted over five days.<sup>(530)</sup>

Iothalamate Meglumine - AHFS 36:68

## Ioxaglate Meglumine and Ioxaglate Sodium - AHFS 36:68

**Products** — Ioxaglate meglumine 39.3% and ioxaglate sodium 19.6% (Mallinckrodt) is available in containers ranging in size from 20 to 200 mL. Each milliliter contains ioxaglate meglumine 393 mg, ioxaglate sodium 196 mg, and edetate calcium disodium 0.1 mg. The product provides 32% organically bound iodine. <sup>(1-2/05)</sup>

*pH* — From 6 to 7.6. <sup>(1-2/05)</sup>

*Osmolality* — The osmolality of the product is 600 mOsm/kg. <sup>(1-2/05)</sup>

*Sodium Content* — Each milliliter provides 0.15 mEq (3.48 mg) of sodium. <sup>(1-2/05)</sup>

*Trade Name(s)* — Hexabrix

**Administration** — The product may be administered intravenously, intra-arterially, or intra-articularly. It also may be injected or instilled directly into selected areas to be visualized. The solutions should be warmed to body temperature before administration. <sup>(1-2/05)</sup>

**Stability** — The product should be stored below 30 °C and protected from freezing and direct exposure to sun or strong daylight. The solution is colorless to pale yellow. Crystallization does not occur at normal room temperatures. If the product is frozen or crystallization occurs, bring it to room temperature and shake vigorously to dissolve all crystals. Warming with circulating warm air is recommended to speed dissolution. Submersion in water is not recommended. <sup>(1-2/05)</sup>

Ioxaglate Meglumine and Ioxaglate Sodium - AHFS 36:68

## Irinotecan Hydrochloride - AHFS 10:00

**Products** — Irinotecan hydrochloride is available in 2- and 5-mL single-use vials containing 40 and 100 mg of drug, respectively, on the basis of the trihydrate. Each milliliter of solution contains irinotecan hydrochloride trihydrate 20 mg, sorbitol 45 mg, lactic acid 0.9 mg, and hydrochloric acid or sodium hydroxide to adjust the pH. The product must be diluted prior to use. <sup>(1-7/08)</sup>

*pH* — From 3 to 3.8. <sup>(1-7/08)</sup>

*Trade Name(s)* — Camptosar

**Administration** — Irinotecan hydrochloride is administered by intravenous infusion over 90 minutes after dilution to a final concentration in the range of 0.12 to 2.8 mg/mL in dextrose 5% or sodium chloride 0.9%. In most clinical trials, the doses were given in 500 mL of dextrose 5%. <sup>(1-7/08)</sup>

**Stability** — Irinotecan hydrochloride injection is supplied as a pale yellow solution. Intact vials should be stored at controlled room temperature and protected from light. Freezing of irinotecan hydrochloride solutions may result in precipitation and should be avoided. Upon dilution in dextrose 5%, the manufacturer recommends use periods of 6 hours at room temperature and 24 hours refrigerated. <sup>(1-7/08)</sup>

Irinotecan hydrochloride (Aventis Pharma) 0.35 mg/mL in sodium chloride 0.9% did not result in the loss of viability of *Staphylococcus aureus*, *Enterococcus faecium*, *Pseudomonas aeruginosa*, and *Candida albicans* within 120 hours at room temperature of 22 °C. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods. <sup>(2740)</sup>

*pH Effects* — Irinotecan hydrochloride stability is pH dependent. In solution at acidic pH the drug is stable, but neutral and alkaline solutions are problematic. Maximum stability is demonstrated at pH 6 or lower. Increasing solution pH to more than pH 6.5 has resulted in 10% loss in as little as three hours. At pH 7.4, decomposition is rapid. Mixing irinotecan hydrochloride with neutral or alkaline drugs and solutions should be avoided. <sup>(1881) (2274) (2375)</sup>

*Light Effects* — Irinotecan hydrochloride is subject to photodegradation, including the formation of a precipitate. The structural changes exhibited by the decomposition products would indicate that they are unlikely to be active antineoplastic compounds. <sup>(1997) (1998) (2137)</sup> Exposure to ultraviolet light for three days produced a darkening in the solution color and the formation of a yellow precipitate composed of several decomposition products. <sup>(1997)</sup> Photodegradation of irinotecan hydrochloride occurs under any pH condition but is accelerated in neutral and alkaline solutions compared with acidic solutions. At pH 10, photodegradation is very rapid; at pH 3 it is much slower. At pH 7, irinotecan 0.34 mg/mL lost 32% in six hours exposed to a daylight lamp and 19% exposed to a white fluorescent light. In infusion solutions having neutral pH, irinotecan hydrochloride exposed to lighting (such as that of a medical facility) may have rapid decomposition. Protection from light exposure has been recommended to maintain product quality during administration. <sup>(1998)</sup> Other researchers have found that unacceptable losses occur within seven days when exposed to fluorescent light but that light protection during administration is not needed. <sup>(2419)</sup>

## Iron Dextran - AHFS 20:04.04

**Products** — Iron dextran is available in 1- and 2-mL vials for intravenous or intramuscular use. It is composed of a dark brown liquid complex of ferric hydroxide and dextran in sodium chloride 0.9%, providing 50 mg of elemental iron per milliliter. <sup>(1-3/06)</sup>

*pH* — From 5.2 to 6.5. <sup>(1-3/06)</sup>

*Trade Name(s)* — INFeD

**Administration** — Iron dextran (INFeD) may be administered by slow intravenous injection at a rate of no more than 1 mL/min or by deep intramuscular injection into the upper outer quadrant of the buttock. Subsequent injections should be made into alternate buttocks. Staining of the skin can be minimized by using a separate needle to withdraw the drug from the container and by displacing the skin laterally prior to injection. <sup>(1-3/06)</sup> (4) Iron dextran also has been administered by intravenous infusion over one to six hours after dilution in sodium chloride 0.9%. <sup>(4)</sup> Dilution in dextrose 5% results in a greater incidence of pain and phlebitis. <sup>(75)</sup> The manufacturer recommends not adding iron dextran injection to parenteral nutrition solutions, <sup>(1-3/06)</sup> especially 3-in-1 mixtures. <sup>(1814)</sup> In adults, a test dose of 25 mg should be given over five minutes <sup>(4)</sup>, with the remainder given after at least one hour has elapsed if no hypersensitivity reaction occurs. <sup>(1-3/06)</sup> (4)

**Stability** — The commercial injection should be stored at controlled room temperature. <sup>(1-3/06)</sup> (4)

*Filtration* — Iron dextran adsorbs to sterilizing membrane filters composed of cellulose nitrate and acetate combined. An iron dextran solution containing 5 mcg/mL in water was estimated to lose 93% of the iron from the first milliliter passed through the filter. As more solution was passed through the filter, a decreasing proportion of the iron was adsorbed, indicating that the filter was approaching saturation. The extent of iron adsorption increased in the presence of electrolytes and trace elements. Adsorption can be substantial, especially when small amounts of iron dextran are involved. <sup>(918)</sup>

### Compatibility Information

## Isoproterenol Hydrochloride (ISOPRENALINE HYDROCHLORIDE) - AHFS 12:12.08.04

**Products** — Isoproterenol hydrochloride is available at a concentration of 0.2 mg/mL in 1- and 5-mL ampuls. In addition to the drug, each milliliter contains sodium chloride 7 mg, sodium lactate 1.8 mg, lactic acid 0.12 mg, sodium metabisulfite 1 mg, and hydrochloric acid to adjust pH in water for injection. <sup>(1-6/06)</sup>

*pH* — From 2.5 to 4.5. <sup>(1-6/06)</sup>

*Osmolality* — The osmolality of isoproterenol hydrochloride 0.2 mg/mL was determined to be 277 mOsm/kg by freezing-point depression and 293 mOsm/kg by vapor pressure. <sup>(1071)</sup>

*Trade Name(s)* — Isuprel HCl

**Administration** — Isoproterenol hydrochloride may be administered by intravenous infusion; by direct intravenous, intramuscular, or subcutaneous injection; and, in extreme emergencies, by intracardiac injection. For direct intravenous injection, 1 mL of the 1:5000 injection should be diluted to 10 mL with sodium chloride 0.9% or dextrose 5% to provide a 20-mcg/mL solution. Intravenous infusions are prepared by adding 1 to 10 mL of the 1:5000 injection to 500 mL of compatible diluent. <sup>(1-6/06)</sup> (4)

**Stability** — Isoproterenol hydrochloride injection in intact containers should be stored at controlled room temperature and protected from light. Ampuls should be kept in opaque containers until used. The drug should not be used if a color or precipitate is present. Exposure to air, light, or increased temperature may cause a pink to brownish pink color to develop. <sup>(1-6/06)</sup> (4) <sup>(975)</sup>

Isoproterenol hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38 °C over four weeks. Analysis found about 4% loss of the drug in seven days and 11% loss in four weeks. <sup>(2562)</sup>

*pH Effects* — The pH of a solution is the primary determinant of catecholamine stability in intravenous admixtures. <sup>(527)</sup> Isoproterenol hydrochloride 5 mg/L in dextrose 5% was stable for more than 24 hours at 25 °C over a pH range of 3.7 to 5.7. <sup>(59)</sup> However, isoproterenol hydrochloride displayed significant decomposition at a pH value above approximately 6. <sup>(48)</sup> <sup>(59)</sup> <sup>(430)</sup> If drugs that may raise the pH above 6 are mixed, they should be administered immediately after preparation <sup>(59)</sup>, or, preferably, administered separately. <sup>(24)</sup>

Visual inspection for color changes related to decomposition may be inadequate to assess the compatibility of admixtures. In one evaluation with aminophylline stored at 25 °C, a color change was not noted until 24 hours had elapsed. However, no intact isoproterenol hydrochloride was present in the admixture at 24 hours. <sup>(527)</sup>

*Filtration* — Isoproterenol hydrochloride (Winthrop) 2 mg/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated, filtered over 12 hours through a 5- $\mu$ m stainless steel depth filter (Argyle Filter Connector), a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2 Filter Set), and a 0.22- $\mu$ m polycarbonate membrane filter (In-Sure Filter Set), showed no significant reduction due to binding to the filters. <sup>(320)</sup>

In another study, isoproterenol hydrochloride (Winthrop) 4 mg/L in dextrose 5% and sodium chloride 0.9% did not display significant sorption to a 0.45- $\mu$ m cellulose membrane filter (Abbott S-A-I-F) during an eight-hour simulated infusion. <sup>(567)</sup>

*Central Venous Catheter* — Isoproterenol hydrochloride (Abbott) 0.02 mg/mL in dextrose 5% was

found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

Isoproterenol Hydrochloride (ISOPRENALINE HYDROCHLORIDE) - AHFS  
12:12.08.04

## Isosorbide Dinitrate - AHFS 24:12.08

**Products** — Isosorbide dinitrate is available as a 0.1% solution in 10-mL ampuls and 50- and 100-mL vials. Each milliliter contains isosorbide dinitrate 1 mg. It also is available as a 0.05% solution in 50-mL vials and 10-mL prefilled syringes. Each milliliter contains isosorbide dinitrate 0.5 mg.<sup>(38)</sup>

**Trade Name(s)** — Isoket, Risordan

**Administration** — Isosorbide dinitrate is administered by intravenous infusion when diluted to a maximum concentration of 0.05% in sodium chloride 0.9% or dextrose 5%. The delivery rate should be controlled using an infusion or syringe pump.<sup>(38)</sup>

Isosorbide dinitrate is also administered as an intracoronary bolus injection during percutaneous transluminal coronary angioplasty.<sup>(38)</sup>

**Stability** — Isosorbide dinitrate injections are colorless and stable in the intact ampuls or vials when stored at room temperature. Once opened, ampuls and vials should be used immediately, and any remainder should be discarded.<sup>(38)</sup>

**Syringes** — Isosorbide dinitrate (Rhone-Poulenc) 1 mg/mL was repackaged in polypropylene syringes (Plastipak, Becton Dickinson) and stored for eight hours at room temperature and 4 °C. No loss of drug was found.<sup>(1799)</sup>

**Sorption** — Several studies have described or evaluated isosorbide dinitrate sorption characteristics. The drug undergoes rapid and extensive sorption to PVC and polyamide containers and PVC administration tubing. Studies have reported isosorbide dinitrate losses ranging from about 15 to 50%, depending on concentration, flow rate, contact time, length of tubing, and temperature. The majority of loss occurs at the beginning of contact with the plastic and then declines as saturation occurs. Isosorbide dinitrate also undergoes sorption of about 16 to 26% to cellulose propionate and butadiene styrene burette chambers but only 2% to methacrylate butadiene styrene burette chambers. However, little or no sorption occurs to glass, polyethylene, polybutadiene, nylon, and polypropylene containers and administration equipment. Consequently, glass, polyethylene, polypropylene, polybutadiene, and polyethylene containers and equipment are recommended while PVC and polyamide are not.<sup>(769) (782) (795) (1027) (1392) (1464) (1465) (1466) (1467) (1619) (2143) (2289)</sup>

**Filtration** — Losses due to sorption of isosorbide dinitrate 250 mg/L in sodium chloride 0.9% delivered at 20 mL/hr through cellulose acetate filters (Sterifix, Ivex HP) were 15 to 26%. Losses to polyamide filters (Pall) were 9 to 13% under the same conditions.<sup>(1465)</sup>

The loss of isosorbide dinitrate due to sorption to filters extends to filters used in hemodialysis. Isosorbide dinitrate 0.1 mg/mL in sodium chloride 0.9% during simulated hemodialysis using five different filter media underwent substantial drug losses from the solution and binding to some of the filters. Losses of approximately 86% with polysulfone (Fresenius), 72% with cellulose acetate (Baxter), 43% with polyacrylonitrile (Hospal), and 12% cuprophan (Gambro) were found. However, with hemophan filters (Gambro), no loss of drug due to sorption occurred.<sup>(2138)</sup>

Isosorbide Dinitrate - AHFS 24:12.08

## Ketamine Hydrochloride - AHFS 28:04.92

**Products** — Ketamine hydrochloride is available in concentrations equivalent to 10, 50, or 100 mg/mL of ketamine base. The injections also contain 0.1 mg/mL of benzethonium chloride. The 10-mg/mL concentration is made isotonic with sodium chloride and is available in 20-mL vials. The 50-mg/mL concentration is available in 10-mL vials, and the 100-mg/mL concentration is available in 5-mL vials. <sup>(1-10/06)</sup>

The 100-mg/mL concentration must be diluted before intravenous use. Dilution of the dose with an equal volume of sterile water for injection, dextrose 5%, or sodium chloride 0.9% is recommended. <sup>(1-10/06)</sup>

*pH* — From 3.5 to 5.5. <sup>(1-10/06)</sup>

*Osmolality* — The osmolalities of ketamine hydrochloride products were determined to be 300 mOsm/kg for the 10-mg/mL concentration and 387 mOsm/kg for the 50-mg/mL concentration. <sup>(1233)</sup>

*Trade Name(s)* — Ketalar

**Administration** — Ketamine hydrochloride may be administered intramuscularly or by slow intravenous injection over at least 60 seconds. The 100-mg/mL preparation should not be given undiluted. For intravenous infusion, a 1- or 2-mg/mL solution may be prepared by adding 500 mg of ketamine to 500 mL or to 250 mL, respectively, of dextrose 5% or sodium chloride 0.9%. Diazepam and barbiturates must be given separately from ketamine hydrochloride and not be mixed in the same container. <sup>(1-10/06)</sup>

**Stability** — Intact vials of ketamine hydrochloride should be stored at controlled room temperature and protected from light. Ketamine hydrochloride injection is a colorless to slightly yellow solution. The drug may darken upon prolonged exposure to light, but this darkening does not affect concentration. Do not use the product if a precipitate is present. <sup>(1-10/06)</sup>

*Syringes* — Ketamine hydrochloride (Abbott) 10 mg/mL diluted in sterile water for injection was packaged in 1-mL polypropylene tuberculin syringes (Becton Dickinson) and was stored at 25 °C. The drug solution remained clear and no loss occurred in 30 days. <sup>(2431)</sup>

Ketamine hydrochloride diluted in sodium chloride 0.9% to 1 mg/mL was packaged in polypropylene syringes with tip caps and stored at 4, 25, and 40 °C for 12 months. No visible changes occurred, and drug concentrations remained above 95% at all temperatures. <sup>(2779)</sup>

<b>Drug (in syringe)</b>	<b>Mfr</b>	<b>Amt</b>	<b>Mfr</b>	<b>Amt</b>	<b>Remarks</b>	<b>Ref</b>	<b>C/I</b>
Bupivacaine HCl with fentanyl citrate	SW JN	1.5 mg/mL 0.01 mg/mL	PD	2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C
Clonidine HCl with tetracaine HCl	BI SW	0.03 mg/mL 2 mg/mL	PD	2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C
Dexamethasone sodium phosphate	OR	50 and 600 mg	PF	1 mg	Diluted to 14 mL with NS. Physically compatible with no loss of either drug in 8 days at 4 and 23 °C	<a href="#">2677</a>	C

Doxapram HCl	RB	400 mg/20 mL	PD	200 mg/20 mL	Physically compatible with no doxapram loss in 9 hr but 12% loss in 24 hr	<a href="#">1177</a>	I
Fentanyl citrate		40 mcg/mL	PF	1 mg/mL	Diluted in sodium chloride 0.9%. Physically compatible for 96 hr at 25 °C	<a href="#">2563</a>	C
Fentanyl citrate with bupivacaine HCl	JN SW	0.01 mg/mL 1.5 mg/mL	PD	2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C
Hydromorphone HCl	SZ	0.2 mg/mL <sup>a</sup>	SZ	0.2, 0.6, 1 mg/mL <sup>a</sup>	Visually compatible. Under 10% loss of both drugs in 7 days at 25 °C	<a href="#">2799</a>	C
Lidocaine HCl with morphine sulfate	AST ES	2 mg/mL 0.2 mg/mL	PD	2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C
Meperidine HCl	DB	12 mg/mL	PD	2 mg/mL	Diluted to 50 mL with NS. Visually compatible for 48 hr at 25 °C	<a href="#">2059</a>	C
Morphine sulfate	SX	1 mg/mL <sup>a</sup> , 10 mg/mL <sup>a</sup>	PD	1 mg/mL <sup>a</sup>	At least 90% of both drugs retained for 6 days at room temperature	<a href="#">2260</a>	C
Morphine sulfate	SX	25 mg/mL <sup>a</sup>	PD	1 mg/mL <sup>a</sup>	5% morphine loss in 6 days at room temperature. Up to 15% ketamine loss in 2 to 6 days	<a href="#">2260</a>	C
Morphine sulfate	SX	1, 10, 25 mg/mL <sup>a</sup>	PD <sup>a</sup>	10, 25 mg/mL	At least 90% of both drugs retained for 6 days at room temperature	<a href="#">2260</a>	C
Morphine sulfate		1 mg/1 mL		5, 10, 20 mg/1 mL	No substantial change in the concentration of either drug over 4 days	<a href="#">669</a>	C
Morphine sulfate	SZ	2, 5, 10 mg/mL <sup>a</sup>	SZ	2 mg/mL <sup>a</sup>	Physically compatible. Little loss of either drug at 23 and 5 °C in 91 days	<a href="#">2797</a>	C
Morphine sulfate with lidocaine HCl	ES AST	0.2 mg/mL 2 mg/mL	PD	2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C
Propofol	NOP	50 mg/5 mL	SZ	50 mg/5 mL	Physically compatible. Little loss of either drug in 3 hr at room temperature	<a href="#">2790</a>	C
Propofol	NOP	70 mg/7 mL	SZ	30 mg/3 mL	Physically compatible. Little loss of either drug in 3 hr at room temperature	<a href="#">2790</a>	C
Tetracaine HCl with clonidine HCl	SW BI	2 mg/mL 0.03 mg/mL	PD	2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C

<sup>a</sup>Diluted in sodium chloride 0.9%.

### **Y-Site Injection Compatibility (1:1 Mixture)**

#### **Ketamine HCl**

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Cefepime HCl	BMS	120 mg/mL <sup>a</sup>		10 mg/mL	Physically compatible with less than 10% cefepime loss. Ketamine not tested	<a href="#">2513</a>	C
Ceftazidime	SKB	125 mg/mL		10 mg/mL	Visually compatible with less than 10% loss of ceftazidime in 24 hr. Ketamine not tested	<a href="#">2434</a>	C
Ceftazidime	GSK	120 mg/mL <sup>a</sup>		10 mg/mL	Physically compatible with less than 10% ceftazidime loss. Ketamine not tested	<a href="#">2513</a>	C
Propofol	ZEN	10 mg/mL	PD	10 mg/mL	Physically compatible for 1 hr at 23 °C	<a href="#">2066</a>	C

<sup>a</sup>Tested in sterile water for injection.

Ketamine Hydrochloride - AHFS 28:04.92

## Ketorolac Tromethamine - AHFS 28:08.04.92

**Products** — Ketorolac tromethamine is available as a 15-mg/mL solution in 1-mL vials and also as a 30-mg/mL solution in 1-mL vials. Ketorolac tromethamine 30 mg/mL is also available in 2-mL vials for intramuscular use. In addition to ketorolac tromethamine, the formulations contain ethanol, sodium chloride, and citric acid in water for injection. The product also contains sodium hydroxide or hydrochloric acid to adjust the pH. <sup>(1-6/08)</sup>

*pH* — From 6.9 to 7.9. <sup>(1-6/08)</sup> (4)

*Tonicity* — Both ketorolac tromethamine concentrations are isotonic. <sup>(4)</sup>

**Administration** — Ketorolac tromethamine is administered slowly by deep intramuscular injection or by intravenous injection over no less than 15 seconds. <sup>(1-6/08)</sup> (4) The 60 mg/2 mL injection is for intramuscular use only. <sup>(1-6/08)</sup>

**Stability** — Ketorolac tromethamine injection should be stored at controlled room temperature and protected from light. The injection is clear and has a slight yellow color. <sup>(1-6/08)</sup> (4) Prolonged exposure to light may result in discoloration of the solution and precipitation. <sup>(4)</sup> Ketorolac tromethamine is chemically stable over a wide pH range from about pH 3 to 11 <sup>(499)</sup>, but precipitation may occur in solutions and with drugs having a relatively low pH. <sup>(4)</sup>

### Compatibility Information

#### Solution Compatibility

##### Ketorolac tromethamine

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.9%	TR <sup>a</sup>	SY	600 mg	Physically compatible. No loss in 48 hr at room temperature	1646	C
Dextrose 5%	TR <sup>b</sup>	SY	600 mg	Physically compatible. No loss in 48 hr at room temperature	1646	C
Dextrose 5%	BA <sup>a</sup>	RC	600 mg	Visually compatible. Little loss in 7 days and 14% loss in 14 days at 25 °C. Less than 2% loss in 50 days at 5 °C	2095	C
Dextrose 5%	a	RC	300 and 600 mg	Visually compatible. Little loss in 21 days at 4 and 23 °C	2442	C
Dextrose 5%	c	RC	200 mg	Visually compatible. Less than 10% loss after -20 °C storage for 90 days, microwave thawing, and storage at 4 °C for 60 days	2645	C
Dextrose 5%	BA <sup>c</sup>	RC	100 and 300 mg	Visually compatible. Less than 3% drug loss after 15 days at -20 °C then 35 days at 4 °C	2707	C
Plasma-Lyte A, pH 7.4	TR <sup>a</sup>	SY	600 mg	Physically compatible. No loss in 48 hr at room temperature	1646	C
Plasma-Lyte A, pH 7.4	TR <sup>b</sup>	SY	60 mg	Physically compatible. No loss in 48 hr at room temperature	1646	C
Ringer's injection	TR <sup>a</sup>	SY	600 mg	Physically compatible. No loss in 48 hr at room temperature	1646	C
Ringer's injection	TR <sup>b</sup>	SY	60 mg	Physically compatible. No loss in 48 hr at room temperature	1646	C
Ringer's injection, lactated	TR <sup>a</sup>	SY	600 mg	Physically compatible. No loss in 48 hr at room temperature	1646	C

Sodium chloride 0.9%	TR <sup>b</sup>	SY	600 mg	Physically compatible. No loss in 48 hr at room temperature	<a href="#">1646</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	RC	600 mg	Visually compatible. No loss in 35 days at 25 °C and in 50 days at 5 °C	<a href="#">2095</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in both glass and PVC containers.

<sup>c</sup>Tested in polyolefin containers.

Ketorolac Tromethamine - AHFS 28:08.04.92

## Labetalol Hydrochloride - AHFS 24:24

**Products** — Labetalol hydrochloride is available in 20- and 40-mL multiple-dose vials and 4- and 8-mL vials and disposable syringes. Each milliliter of solution contains labetalol hydrochloride 5 mg, dextrose, anhydrous 45 mg, edetate disodium 0.1 mg, methylparaben 0.8 mg, propylparaben 0.1 mg, and citric acid anhydrous and sodium hydroxide as necessary to adjust pH in water for injection. (1-2/07)

*pH* — From 3 to 4.5. (17)

**Administration** — Labetalol hydrochloride is administered by slow direct intravenous injection, over two minutes, or by continuous intravenous infusion at an initial rate of 2 mg/min with subsequent adjustments based on blood pressure response. For continuous infusion, concentrations of 1 mg/mL or 2 mg/3 mL can be made by adding 200 mg (40 mL) to 160 or 250 mL of compatible infusion solution. To facilitate the infusion of labetalol hydrochloride at an accurate rate of administration, a controlled-infusion device, such as a pump, may be used. (1-2/07) (4)

**Stability** — Labetalol hydrochloride may be stored at room temperature or under refrigeration and should be protected from light and freezing. The solution is clear and colorless to slightly yellow. (1-2/07)

*pH Effects* — Labetalol hydrochloride has optimal stability at pH 3 to 4. Addition to an alkaline drug or solution has resulted in precipitate formation. (757) (1715) (2062)

Labetalol Hydrochloride - AHFS 24:24

## Lenograstim - AHFS 20:16

**Products** — Lenograstim (rHuG-CSF) is available as a lyophilized powder in single-use vials containing 13.4 million I.U. (Granocyte-13) or 33.6 million I.U. (Granocyte-34). In addition to lenograstim, each vial of the product contains mannitol 2.5%, arginine 1%, phenylalanine 1%, methionine 0.1%, polysorbate 20 0.01%, and hydrochloric acid to adjust pH. <sup>(38)</sup>

Lenograstim vials of either strength should be reconstituted with 1.05 mL of the accompanying water for injection diluent. Gently mix to effect dissolution, usually about 5 seconds. Do not shake the vials vigorously. Both the lenograstim vials and the diluent are overfilled by 5% to permit withdrawal of a full 1 mL of the reconstituted product containing 13.4 or 33.6 million I.U. <sup>(38)</sup>

**Units** — Each 13.4-million I.U. vial contains 105 mcg of lenograstim. Each 33.6-million I.U. vial contains 263 mcg of lenograstim. <sup>(38)</sup>

**pH** — The reconstituted solution has a pH buffered to 6.5. <sup>(38)</sup>

**Trade Name(s)** — Granocyte-13, Granocyte-34

**Administration** — Lenograstim is administered by subcutaneous injection and intravenous infusion after dilution in sodium chloride 0.9% in glass or PVC containers or dextrose 5% in glass containers. Granocyte 13 should not be diluted to a concentration lower than 0.26 million I.U. per milliliter (2 mcg/mL); Granocyte-34 should not be diluted to a concentration lower than 0.32 million I.U. per milliliter (2.5 mcg/mL). The dilution volume should not exceed 50 mL for each vial of Granocyte-13 and 100 mL for each vial of Granocyte-34. <sup>(38)</sup>

**Stability** — Intact vials of lenograstim should be stored at 30 °C or below and protected from freezing. When reconstituted as directed, lenograstim is stable for 24 hours under refrigeration. Diluted for administration to concentrations not less than 0.26 million I.U. (Granocyte-13) or 0.32 million I.U. (Granocyte-34) per milliliter, lenograstim is stable for up to 24 hours at 5 or 25 °C. <sup>(38)</sup>

At concentrations not less than 0.26 million I.U. (Granocyte-13) or 0.32 million I.U. (Granocyte-34) per milliliter, lenograstim is stable for up to 24 hours at 5 or 25 °C in sodium chloride 0.9% in both PVC and glass containers and in dextrose 5% in glass containers. <sup>(38)</sup>

**Ambulatory Pumps** — The stability of lenograstim (Rhone-Poulenc Rorer) 33.6 million I.U. (263 mcg) and 67.2 million I.U. (526 mcg) each in 100 mL of sodium chloride 0.9% filled into Intermate elastomeric infusion devices (Baxter) was evaluated stored at 4 °C for 14 days. No loss of lenograstim was found. <sup>(2048)</sup>

**Sorption** — Lenograstim prepared in sodium chloride 0.9% is compatible with PVC containers and common administration sets. <sup>(38)</sup>

## Lepirudin - AHFS 20:12.04.92

**Products** — Lepirudin is available as a lyophilized powder in vials containing 50 mg of drug along with 40 mg of mannitol and sodium hydroxide for pH adjustment. Reconstitute the vials with 1 mL of sterile water for injection or sodium chloride 0.9% and shake gently to yield a 50-mg/mL solution. Dissolution usually occurs within a few seconds but definitely in less than three minutes. The reconstituted solution must be diluted for use. <sup>(1-12/06)</sup>

*pH* — Approximately 7. <sup>(1-12/06)</sup>

**Units** — Lepirudin activity is measured in antithrombin units (ATU). One ATU is the amount of lepirudin that neutralizes one unit of World Health Organization preparation 89/588 thrombin. <sup>(1-12/06)</sup>

**Specific Activity** — Lepirudin has a specific activity of 16,000 ATU per milligram of drug. <sup>(1-12/06)</sup>

**Trade Name(s)** — Refludan

**Administration** — Lepirudin is administered slowly intravenously over 15 to 20 seconds initially and is followed by continuous intravenous infusion. For the initial intravenous bolus dose, the reconstituted solution is diluted to a concentration of 5 mg/mL. One milliliter of the reconstituted solution is diluted with 9 mL of sodium chloride 0.9%, dextrose 5%, or sterile water for injection in a sterile 10-mL or larger syringe. For intravenous infusion, lepirudin concentrations of 0.2 or 0.4 mg/mL are prepared by adding the reconstituted contents of two vials to 500 or 250 mL, respectively, of sodium chloride 0.9% or dextrose 5%. <sup>(1-12/06)</sup>

**Stability** — Intact vials of lepirudin should be stored between 2 and 25 °C. The manufacturer recommends use of the reconstituted solution immediately after preparation. The clear, colorless reconstituted solution is stable 24 hours at room temperature. Diluted for administration to a concentration between 0.2 and 5 mg/mL, lepirudin is also stable for 24 hours at room temperature. <sup>(1-12/06)</sup> (4)

Lepirudin - AHFS 20:12.04.92

## Leucovorin Calcium - AHFS 92:12

**Products** — Leucovorin calcium is available in lyophilized form in vials containing leucovorin 50, 100, 200, 350, and 500 mg as the calcium salt with sodium chloride and sodium hydroxide or hydrochloric acid to adjust the pH. Reconstitute the vials with bacteriostatic water for injection containing benzyl alcohol or sterile water for injection with the volumes indicated in Table 1. <sup>(1-1/04)</sup> <sup>(4)</sup>

**Table 1. Recommended Reconstitution of Leucovorin Calcium** <sup>(1-1/04)</sup> <sup>(4)</sup>

Vial Size (mg)	Volume of Diluent (mL)	Concentration (mg/mL)
50	5	10
100	10	10
200	20	10
350	17.5	20
500	50	10

Leucovorin calcium is also available at a concentration of 10 mg/mL containing no preservative in vials of 10, 25, and 30 mL. <sup>(4)</sup>

*pH* — From 6.5 to 8.5. <sup>(17)</sup>

**Administration** — Leucovorin calcium is administered by intramuscular or intravenous injection or infusion at a rate not exceeding 160 mg/min. When doses greater than 10 mg/m<sup>2</sup> are required, diluents containing benzyl alcohol should not be used for reconstitution. <sup>(1-1/04)</sup> <sup>(4)</sup>

**Stability** — Leucovorin calcium injection should be stored at room temperature and protected from light. <sup>(1-1/04)</sup> <sup>(4)</sup>

The reconstituted solution of leucovorin calcium is stated to be stable for seven days. When reconstituted with diluents that contain no preservatives, immediate use is recommended. <sup>(1-1/04)</sup>

*pH Effects* — Leucovorin calcium solutions exhibit good stability at pH 6.5 to 10. The pH of maximum stability was determined to be 7.1 to 7.4. Below pH 6, increased decomposition occurs. <sup>(1276)</sup>

*Central Venous Catheter* — Leucovorin calcium (Gensia) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>d</sup>Lyophilized formulation tested.

<sup>e</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>f</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>g</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

---

### **Additional Compatibility Information**

*Fluorouracil* — Several articles reported the chemical stability and physical compatibility of fluorouracil with leucovorin calcium.<sup>(505) (980) (1309) (1387) (1817)</sup> However, more recent work found substantial amounts of subvisual particles in this drug combination over numerous concentrations when stored at 4, 23, and 32 °C. Particulate formation sometimes clogged filters and disrupted multiple-day treatment. Particulate formation began in about 24 hours in most samples, and particles were found in all samples within seven days. Fluorouracil and leucovorin calcium in the same container can no longer be considered a compatible combination.<sup>(1816)</sup>

Fluorouracil combined with leucovorin calcium for repeated administration using a Fresenius implanted port resulted in blockage of the pump catheter and necessitated surgical removal of the port. The blockage was caused by precipitation of calcium carbonate in the catheter.<sup>(2504)</sup>

## Levetiracetam - AHFS 28:12.92

**Products** — Levetiracetam is available as a 100-mg/mL concentrate for injection in 5-mL single-use vials.<sup>(2833)</sup> The concentrate must be diluted before administration.<sup>(2833)</sup>

Levetiracetam is also available as a single-use, ready-to-use solution for intravenous infusion containing 500 mg, 1 g, or 1.5 g levetiracetam in 100 mL sodium chloride in dual-port plastic bags.<sup>(2834)</sup>

Both the concentrate and the ready-to-use formulations contain water for injection and sodium chloride.<sup>(2833)</sup> <sup>(2834)</sup>

*pH* — Levetiracetam concentrate and ready-to-use solutions for infusion have a pH adjusted to approximately 5.5 with glacial acetic acid and sodium acetate trihydrate.<sup>(2833)</sup> <sup>(2834)</sup>

*Osmolality* — The osmolality of levetiracetam 100-mg/mL concentrate for injection was determined to be approximately 950 mOsm/kg.<sup>(2835)</sup> Following dilution of 500 mg of the concentrate in 100 mL of sodium chloride 0.9%, the osmolality of levetiracetam was determined to be approximately 430 mOsm/kg.<sup>(2835)</sup>

*Sodium Content* — Ready-to-use solutions of levetiracetam 500 mg, 1 g, and 1.5 g in 100 mL of sodium chloride injection contain 820, 750, and 540 mg of sodium, respectively.<sup>(2834)</sup>

*Trade Name(s)* — Keppra

**Administration** — Single-use vials contain levetiracetam concentrate that is administered by intravenous infusion after dilution in 100 mL of a compatible diluent.<sup>(2833)</sup> Single-use, ready-to-use solutions of levetiracetam should not be further diluted prior to intravenous infusion.<sup>(2834)</sup>

Levetiracetam is administered by intravenous infusion over 15 minutes.<sup>(2833)</sup> <sup>(2834)</sup>

**Stability** — Levetiracetam concentrate and diluted solutions should be clear and colorless.<sup>(2833)</sup> <sup>(2834)</sup> Intact vials of levetiracetam concentrate and ready-to-use bags of levetiracetam in solution in their unopened aluminum overwrap should be stored at controlled room temperature.<sup>(2833)</sup> <sup>(2834)</sup> Discolored products or products containing particulate matter should not be used.<sup>(2833)</sup> <sup>(2834)</sup> Ready-to-use levetiracetam infusion bags should be used promptly once the aluminum overwrap has been removed.<sup>(2834)</sup>

The unused contents of an opened vial or a partially used infusion bag should be discarded.<sup>(2833)</sup> <sup>(2834)</sup> The diluted contents of a vial of levetiracetam concentrate should be used within 24 hours.<sup>(2835)</sup>

Levetiracetam - AHFS 28:12.92

## Levofloxacin - AHFS 8:12.18

**Products** — Levofloxacin is available as a 25-mg/mL preservative-free aqueous solution in 20-mL (500-mg) and 30-mL (750-mg) single-use vials. This concentration must be diluted to a 5-mg/mL concentration for administration. Adding 250 mg (10 mL) to 40 mL of diluent, 500 mg (20 mL) to 80 mL of diluent, or 750 mg (30 mL) to 120 mL of diluent will result in a 5-mg/mL concentration. (1-10/08)

The drug is also available as premixed infusion solutions of 5 mg/mL in dextrose 5% in 50-mL (250-mg), 100-mL (500-mg), and 150-mL (750-mg) flexible plastic bags. The solutions in plastic bags are ready to use and require no dilution. Sodium hydroxide and hydrochloric acid may have been added to adjust the pH. (1-10/08)

*pH* — From 3.8 to 5.8. (1-10/08)

The pH of a 5-mg/mL concentration in dextrose or sodium chloride solutions is about 4.6 to 4.7. In solutions with a greater buffering capacity, pH values are higher. A 5-mg/mL concentration had a pH of 4.9 in dextrose 5% in Ringer's injection, lactated, a pH of 5.0 in Plasma-Lyte 56/5% dextrose, and a pH of 5.5 in sodium lactate (1/6) M. (1-10/08)

*Tonicity* — The premixed infusion solutions are nearly isotonic. (1-10/08)

*Trade Name(s)* — Levaquin

**Administration** — Levofloxacin is administered only at 5-mg/mL by slow intravenous infusion over at least 60 minutes. Doses of 750 mg should be administered over 90 minutes. No other route is recommended. Rapid infusion or bolus administration must not be used because of the potential for hypotension. The 25-mg/mL concentrate must be diluted to 5 mg/mL for administration. (1-10/08) (4)

**Stability** — Intact vials should be stored at controlled room temperature and protected from light. The premixed infusion solutions should be stored at or below 25 °C and protected from light, freezing, and excessive heat. A brief exposure to temperatures up to 40 °C does not adversely affect concentration. (1-10/08) The injection and infusion admixtures are clear and yellow to greenish yellow in appearance. This color does not adversely affect the product. (1-10/08) (1986) Discard any remaining unused portion of the injection because no preservatives are present. (1-10/08)

Levofloxacin diluted in a compatible diluent to 5 mg/mL is stated to be stable for 72 hours stored at or below 25 °C and for 14 days stored at 5 °C. (1-10/08)

Levofloxacin may form stable coordination compounds with metal ions. The chelation potential is greatest with  $\text{Al}^{3+}$  and declines from  $\text{Cu}^{2+}$  to  $\text{Zn}^{2+}$  to  $\text{Mg}^{2+}$  to  $\text{Ca}^{2+}$ . (1-10/08)

*pH Effects* — Levofloxacin has a solubility of 100 mg/mL at pH values ranging from 0.6 to 5.8. The solubility increases as pH increases up to 6.7, with a maximum solubility of 272 mg/mL. Above pH 6.7, solubility decreases to a minimum of 50 mg/mL at pH 6.9. (1-10/08)

*Freezing Solutions* — Levofloxacin 5 mg/mL diluted in a compatible diluent in glass bottles or plastic infusion containers is stable for six months frozen at -20 °C. Frozen solutions should be thawed at room temperature or in the refrigerator. Accelerated thawing using microwaves or hot water immersion is not recommended. Thawed solutions should not be refrozen. (1-10/08)

*Light Effects* — Levofloxacin undergoes slow degradation when exposed to ultraviolet light. (2399) Losses have been reported upon long-term light exposure. (2636)

*Central Venous Catheter* — Levofloxacin (McNeil) 1 mg/mL in dextrose 5% was found to be

compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Levothyroxine sodium - AHFS 68:36.04

**Products** — Levothyroxine sodium is available in 200- and 500-mcg vials. Also present in the vials are mannitol 10 mg, tribasic sodium phosphate anhydrous 0.7 mg, and sodium hydroxide to adjust pH during manufacturing. Reconstitute the 200-mcg vials by adding 2 or 5 mL of sodium chloride 0.9%, resulting in solutions containing 40 or 100 mcg/mL, respectively. Reconstitute the 500-mcg vials by adding 5 mL of sodium chloride 0.9% or bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol, resulting in a solution containing 100 mcg/mL. Shake well to ensure complete dissolution. <sup>(1-5/03)</sup> (4)

**Trade Name(s)** — Synthroid

**Administration** — Levothyroxine sodium injection may be administered by intravenous or intramuscular injection. <sup>(1-5/03)</sup>

**Stability** — Intact vials should be stored at controlled room temperature and protected from light. The manufacturer states that the reconstituted levothyroxine sodium should be used immediately after reconstitution. Any remaining solution should be discarded. The manufacturer also states levothyroxine sodium injection should not be added to intravenous solutions. <sup>(1-5/03)</sup>

**Syringes** — Levothyroxine sodium 0.1 mg/mL in sodium chloride 0.9% was packaged as 5 mL in 6-mL polypropylene syringes (Monoject). No loss of drug was found after seven days at 5 °C. <sup>(2354)</sup>

Levothyroxine sodium - AHFS 68:36.04

## Lidocaine Hydrochloride (LIGNOCAINE HYDROCHLORIDE) - AHFS 24:04.04.08

**Products** — Lidocaine hydrochloride for direct intravenous use is available in concentrations of 10 and 20 mg/mL in ampuls and vials from 5 to 50 mL and in 5-mL prefilled syringes. The drug is also available as 40-, 100-, and 200-mg/mL concentrates for intravenous admixture preparation. The pH of these solutions is adjusted with sodium hydroxide and/or hydrochloric acid. Multiple-dose vials and automatic injection devices may also have methylparaben and EDTA or sulfites.<sup>(4)</sup>

Lidocaine hydrochloride is also available premixed in dextrose 5% in concentrations of 0.2, 0.4, and 0.8% (2, 4, and 8 mg/mL, respectively). The solutions come in container sizes ranging from 250 to 1000 mL.<sup>(4)</sup>

*pH* — The pH of the injection is about 6.5 but may range from 5 to 7.<sup>(1)</sup> <sup>(4)</sup> The premixed infusion solutions in dextrose 5% have a pH of 3 to 7.<sup>(4)</sup> <sup>(17)</sup>

*Osmolality* — The osmolalities of lidocaine hydrochloride products were determined to be 296 mOsm/kg for the 10-mg/mL concentration and 352 mOsm/kg for the 20-mg/mL concentration.<sup>(1233)</sup>

The commercially available lidocaine hydrochloride 0.2, 0.4, and 0.8% premixed solutions have osmolarities of approximately 266, 281, and 308 mOsm/L, respectively.<sup>(4)</sup>

*Trade Name(s)* — Xylocaine

**Administration** — Lidocaine hydrochloride is administered by direct intravenous injection and continuous intravenous infusion.<sup>(4)</sup> It may also be administered by intramuscular injection.<sup>(4)</sup> <sup>(118)</sup> <sup>(119)</sup> <sup>(120)</sup> Products containing 40, 100, or 200 mg/mL should not be administered by direct intravenous injection without prior dilution to 1- or 2-mg/mL (0.1 or 0.2%) solution. Lidocaine hydrochloride products containing preservatives should not be given intravenously. Products containing epinephrine should not be used to treat arrhythmias.<sup>(4)</sup>

**Stability** — Lidocaine hydrochloride injection and premixed infusion solutions should be stored at controlled room temperature and protected from excessive heat and freezing.<sup>(4)</sup>

*pH Effects* — Although lidocaine hydrochloride is stable across a broad pH range, its pH of maximum stability is 3 to 6.<sup>(1277)</sup>

Buffering lidocaine hydrochloride injection with sodium bicarbonate has been used to reduce pain on injection. Increasing the pH results in an increased percentage of the drug being present as the unionized base, which is less stable and soluble. Lidocaine base precipitation has been shown to occur at a pH around 7.5 to 7.6.<sup>(2409)</sup>

The stability of lidocaine hydrochloride 2%, with and without epinephrine hydrochloride, was studied after alkalization with sodium bicarbonate. Lidocaine hydrochloride alone was alkalized to pH 7.2, while the lidocaine-epinephrine combination was adjusted to pH 6.5 and also 7.05. The combinations were compatible, and no loss of lidocaine or epinephrine occurred over six hours.<sup>(1401)</sup>

The stability of lidocaine hydrochloride 1% (Elkins-Sinn) buffered with sodium bicarbonate to pH 6.8, 7.2, and 7.4 was evaluated. No loss occurred in 27 days at pH 6.8. At pH 7.2, adequate concentrations were retained for 19 days but by 27 days concentrations had fallen to about 88% and a crystalline precipitate formed. At pH 7.4, losses of up to 23% were accompanied by crystalline precipitation between 5 and 15 days.<sup>(2407)</sup>

Lidocaine hydrochloride is stable when mixed with certain acid-stable drugs such as epinephrine

hydrochloride, norepinephrine bitartrate, and isoproterenol hydrochloride. However, its buffering action may raise the pH of intravenous admixtures above 5.5, the maximum pH for stability of the other drugs. The final pH is usually about 6. These drugs begin to deteriorate within several hours. Note: This does not apply to commercial lidocaine-epinephrine combinations, which have the pH adjusted to retain epinephrine.<sup>(24)</sup>

*Syringes* — Lidocaine hydrochloride (Abbott) 20 mg/mL was packaged as 10 mL of undiluted injection in 12-mL polypropylene syringes (Becton Dickinson) and stored at 23 °C under fluorescent light and 4 °C. No lidocaine loss was found after 90 days of storage.<sup>(2428)</sup>

Lidocaine hydrochloride 2% (20 mg/mL) in autoinjector syringes (Abbott) was evaluated for stability over 45 days under use conditions in paramedic vehicles. Temperatures fluctuated with locations and conditions and ranged from 6.5 °C (43.7 °F) to 52 °C (125.6 °F) in high desert conditions. No visually apparent changes occurred, and no loss was found.<sup>(2548)</sup>

Lidocaine hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38 °C over four weeks. No loss of the drug occurred.<sup>(2562)</sup>

*Sorption* — Lidocaine hydrochloride in solutions with acidic pH was shown not to exhibit sorption to PVC bags and tubing, elastomeric pump reservoirs, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>(12) (536) (606) (2014)</sup>

However, in a slightly alkaline (pH 8) cardioplegia solution, the percentage of unionized lidocaine base increased to 58%. This compares to 3% in dextrose 5% and sodium chloride 0.9% at around pH 6. The unionized form is highly lipid soluble and may interact with PVC bags. Storage of the cardioplegia solutions in PVC bags at 22 °C resulted in a 12 to 19% lidocaine loss in two days and a 65 to 75% loss in 21 days. Degradation was not likely because storage in glass bottles did not result in any lidocaine loss after 21 days at 22 °C. Refrigeration of the PVC bags at 4 °C slowed the lidocaine loss to 9% or less in 21 days.<sup>(776)</sup>

*Filtration* — Lidocaine hydrochloride (Astra) 200 mg/L in dextrose 5% and sodium chloride 0.9% did not display significant sorption to a 0.45-µm cellulose membrane filter (Abbott S-A-I-F) during an eight-hour simulated infusion.<sup>(567)</sup>

*Central Venous Catheter* — Lidocaine hydrochloride (Astra) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

## Compatibility Information

Methohexital sodium	BP	2 g	BP	2 g	D5W	Precipitates immediately	<a href="#">26</a>	I
Nafcillin sodium	AP	20 g	AST	0.6 g	D5W <sup>a</sup> , NS <sup>d</sup>	Visually compatible. Little nafcillin loss in 48 hr at 23 °C. Lidocaine not tested	<a href="#">1806</a>	C
Nitroglycerin	ACC	400 mg	IMS	4 g	D5W, NS <sup>e</sup>	Physically compatible. No nitroglycerin loss in 48 hr at 23 °C. Lidocaine not tested	<a href="#">929</a>	C
Penicillin G potassium	SQ	1 million units	AST	2 g		Physically compatible	<a href="#">24</a>	C
Pentobarbital sodium	AB	500 mg	AST	2 g		Physically compatible	<a href="#">24</a>	C
Phenylephrine HCl	WI	20 mg	AST	2 g		Physically compatible	<a href="#">24</a>	C
Phenytoin sodium	ES	1 g	AST	2 g	D5W, LR, NS	Immediate formation of a white cloudy precipitate	<a href="#">775</a>	I
Potassium chloride	AB	40 mEq	AST	2 g		Physically compatible	<a href="#">24</a>	C
Procainamide HCl	SQ	1 g	AST	2 g	D5W, LR, NS	Physically compatible for 24 hr at 25 °C	<a href="#">775</a>	C
Prochlorperazine edisylate	SKF	10 mg	AST	2 g		Physically compatible	<a href="#">24</a>	C
Ranitidine HCl	GL	50 mg and 2 g	AST	1 and 8 g	D5W, NS <sup>a</sup>	Physically compatible. 3% ranitidine loss in 24 hr at room temperature in light. Lidocaine not tested	<a href="#">1361</a>	C
Ranitidine HCl	GL	50 mg and 2 g		2.5 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Lidocaine not tested	<a href="#">1515</a>	C
Ranitidine HCl	GL	50 mg and 2 g	AST	1 and 8 g	D5W, NS <sup>a</sup>	Visually compatible. Little loss of either drug in 48 hr at room temperature	<a href="#">1802</a>	C
Sodium bicarbonate	AB	40 mEq	AST	2 g		Physically compatible	<a href="#">24</a>	C
Sodium bicarbonate	AB	2.4 mEq <sup>c</sup>		1 g	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Sodium lactate	AB	50 mEq	AST	2 g		Physically compatible	<a href="#">24</a>	C
Theophylline		2 g		380 mg	D5W	Visually compatible with little or no loss of either drug in 48 hr	<a href="#">1909</a>	C
Verapamil HCl	KN	80 mg	IMS	2 g	D5W, NS	Physically compatible for 48 hr	<a href="#">739</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in both glass and PVC containers.

<sup>c</sup>One vial of Neut added to a liter of admixture.

<sup>d</sup>Tested in polyolefin containers.

<sup>e</sup>Tested in glass containers.**Drugs in Syringe Compatibility****Lidocaine HCl**

<b>Drug (in syringe)</b>	<b>Mfr</b>	<b>Amt</b>	<b>Mfr</b>	<b>Amt</b>	<b>Remarks</b>	<b>Ref</b>	<b>C/I</b>

Warfarin sodium	DME	2 mg/mL <sup>f</sup>	AST	2 mg/mL <sup>a</sup>	Visually compatible for 24 hr at 24 °C	<a href="#">2078</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>e</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture.

<sup>f</sup>Tested in sterile water for injection.

<sup>g</sup>Preservative free.

<sup>h</sup>Tested in dextrose 5% in sodium chloride 0.225%.

<sup>i</sup>Final concentration after mixing.

<sup>j</sup>Nesiritide is incompatible with bisulfite antioxidants used in some drug formulations. The specific formulation of the product to be used should be checked to ensure that no sulfite antioxidants are present.

<sup>k</sup>Tested in combination with hydrocortisone sodium succinate (Upjohn) 100 mg/L

<sup>l</sup>Tested in combination with heparin sodium (Riker) 1000 units/L.

Lidocaine Hydrochloride (LIGNOCAINE HYDROCHLORIDE) - AHFS

24:04.04.08

## Lincomycin Hydrochloride - AHFS 8:12.28.20

**Products** — Lincomycin hydrochloride is available in 2- and 10-mL vials. Each milliliter contains lincomycin hydrochloride equivalent to lincomycin base 300 mg and benzyl alcohol 9.45 mg in water for injection. [\(1-6/07\)](#) <sup>(4)</sup>

*pH* — From 3 to 5.5. <sup>(17)</sup>

*Trade Name(s)* — Lincocin

**Administration** — Lincomycin hydrochloride may be administered by deep intramuscular injection, slow intravenous infusion, or subconjunctival injection. [\(1-6/07\)](#) <sup>(4)</sup> For intravenous administration, each gram of lincomycin should be diluted in 100 mL or more of compatible infusion solution and infused over at least one hour. <sup>(4)</sup>

**Stability** — Lincomycin hydrochloride injection should be stored at controlled room temperature and protected from freezing. [\(1-6/07\)](#) <sup>(4)</sup>

### Compatibility Information

#### Solution Compatibility

##### Lincomycin HCl

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.9%		UP	1.2 g	Stable for 24 hr	<a href="#">109</a>	C
Dextrose 5%		UP	1.2 g	Stable for 24 hr	<a href="#">109</a>	C
Dextrose 10%		UP	1.2 g	Stable for 24 hr	<a href="#">109</a>	C
Dextrose 10% in sodium chloride 0.9%				Physically compatible for 24 hr at room temperature	<a href="#">1(6/07)</a>	C
Ringer's injection				Physically compatible for 24 hr at room temperature	<a href="#">1(6/07)</a>	C
Sodium chloride 0.9%		UP	1.2 g	Stable for 24 hr	<a href="#">109</a>	C
Sodium lactate (1/6) M				Physically compatible for 24 hr at room temperature	<a href="#">1(6/07)</a>	C

#### Additive Compatibility

##### Lincomycin HCl

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Amikacin sulfate	BR	5 g	UP	10 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25 °C	<a href="#">293</a>	C
Ampicillin sodium						Physically compatible for 24 hr at room temperature	<a href="#">1(6/07)</a>	C
Chloramphenicol sodium succinate						Physically compatible for 24 hr at room temperature	<a href="#">1(6/07)</a>	C

Cytarabine	UP	500 mg		1, 1.5, 2, 2.4, 3 g		Physically compatible for 48 hr	<a href="#">174</a>	C
Heparin sodium	AB	20,000 units	UP	600 mg		Physically compatible	<a href="#">21</a>	C
Penicillin G potassium	SQ	20 million units	UP	6 g	D5W	Physically compatible	<a href="#">15</a>	C
Penicillin G potassium	SQ	5 million units	UP	600 mg	D	Physically compatible	<a href="#">47</a>	C
Penicillin G sodium	UP	20 million units	UP	6 g	D5W	Physically compatible	<a href="#">15</a>	C
Polymyxin B sulfate						Physically compatible for 24 hr at room temperature	<a href="#">1(6/07)</a>	C
Ranitidine HCl	GL	50 mg and 2 g		2.4 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Lincomycin not tested	<a href="#">1515</a>	C

### Drugs in Syringe Compatibility

#### Lincomycin HCl

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Ampicillin sodium	AY	500 mg	UP	600 mg/2 mL	Physically incompatible within 1 hr at room temperature	<a href="#">99</a>	I
Ampicillin sodium	AY	500 mg	UP	600 mg/2 mL	Precipitate forms within 1 hr at room temperature	<a href="#">300</a>	I
Cloxacillin sodium	AY	250 mg	UP	600 mg/2 mL	Physically compatible for 1 hr at room temperature	<a href="#">300</a>	C
Cloxacillin sodium	BE	250 mg	UP	600 mg/2 mL	No precipitate or color change within 1 hr at room temperature	<a href="#">99</a>	C
Doxapram HCl	RB	400 mg/20 mL		300 mg/1 mL	Physically compatible with no doxapram loss in 24 hr	<a href="#">1177</a>	C
Heparin sodium	AB	20,000 units/1 mL	UP	600 mg/2 mL	Physically compatible for at least 30 min	<a href="#">21</a>	C
Penicillin G sodium		1 million units	UP	600 mg/2 mL	No precipitate or color change within 1 hr at room temperature	<a href="#">99</a>	C

Lincomycin Hydrochloride - AHFS 8:12.28.20

## Linezolid - AHFS 8:12.28.24

**Products** — Linezolid is available as a single-use, ready-to-use solution for infusion in 100-, 200-, and 300-mL plastic (Excel) containers. Each milliliter of the ready-to-use infusion provides linezolid 2 mg along with dextrose 50.24 mg, sodium citrate 1.64 mg, and citric acid 0.85 mg in water for injection. [\(1-7/08\)](#)

*pH* — Adjusted to pH 4.8. [\(1-7/08\)](#)

*Sodium Content* — The sodium concentration is 0.38 mg/mL. The sodium content in a 100-mL bag is 1.7 mEq, in a 200-mL bag is 3.3 mEq, and in a 300-mL bag is 5 mEq. [\(1-7/08\)](#)

*Trade Name(s)* — Zyvox

**Administration** — Linezolid ready-to-use solution is administered only by intravenous infusion over a period of 30 to 120 minutes. [\(1-7/08\)](#)

**Stability** — Linezolid ready-to-use solutions may exhibit a yellow color that can intensify over time without affecting the stability of the drug. Intact containers should be kept in their protective overwrap until ready to use, and should be stored at controlled room temperature and protected from light and freezing. [\(1-7/08\)](#)

Linezolid 150, 300, and 600 mg/L in Dianeal PD-2 with 1.5 or 4.25% dextrose stored at 37, 25, and 4 °C protected from light was physically compatible and exhibited no loss. [\(2500\)](#)

*Sorption* — Linezolid was found to be compatible with common types of intravenous administration sets including diethylhexyl phthalate (DEHP) plasticized PVC, trioctyl trimellitate (TOTM) plasticized PVC, and polyolefin sets. The total dose of linezolid was fully delivered with the delivered concentration remaining constant throughout. In addition, no detectable levels of plasticizer were found in the delivered solutions. [\(2338\)](#)

### Compatibility Information

#### Solution Compatibility

##### Linezolid

Solution	Mfr	Mfr Conc/L	Remarks	Ref	C/I
Dextrose 5%	PF		Compatible	<a href="#">1(7/08)</a>	C
Ringer's injection, lactated	PF		Compatible	<a href="#">1(7/08)</a>	C
Sodium chloride 0.9%	PF		Compatible	<a href="#">1(7/08)</a>	C

#### Additive Compatibility

##### Linezolid

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Aztreonam	SQ	20 g	PHU	2 g	<a href="#">a</a>	Physically compatible with no linezolid loss in 7 days at 4 and 23 °C protected from light. About 9% aztreonam loss at 23 °C and less than 4% loss at 4 °C in 7 days	<a href="#">2263</a>	C
Cefazolin sodium	APC	10 g	PHU	2 g	<a href="#">a</a>	Physically compatible with 5% or less loss of each drug in 3 days at 23 °C and 7 days at 4	<a href="#">2262</a>	C

Ceftazidime	GW	20 g	PHU 2 g	<a href="#">a</a>	°C protected from light Physically compatible with no linezolid loss in 7 days at 4 and 23 °C protected from light. Ceftazidime losses of 5% in 24 hr and 12% in 3 days at 23 °C and about 3% in 7 days at 4 °C	<a href="#">2262</a>	C
Ceftriaxone sodium	RC	10 g	PHU 2 g	<a href="#">a</a>	Physically compatible, but up to 37% ceftriaxone loss in 24 hr at 23 °C and 10% loss in 3 days at 4 °C	<a href="#">2262</a>	I
Ciprofloxacin	BAY	4 g	PHU 2 g	<a href="#">a</a>	Physically compatible with little or no loss of either drug in 7 days at 23 °C protected from light. Refrigeration results in precipitation after 1 day	<a href="#">2334</a>	C
Erythromycin lactobionate	AB	5 g	PHU 2 g	<a href="#">a</a>	Erythromycin loss of 15% in 1 hr and 30% in 4 hr at 23 °C. Loss of 45% in 1 day at 4 °C	<a href="#">2333</a>	I
Gentamicin sulfate	AB	800 mg	PHU 2 g	<a href="#">a</a>	Physically compatible. Little linezolid loss in 7 days at 4 and 23 °C in dark. Gentamicin losses of 5 to 7% in 7 days at 4 °C and 8% in 5 days at 23 °C	<a href="#">2332</a>	C
Levofloxacin	OMN	5 g	PHU 2 g	<a href="#">a</a>	Physically compatible. Little drug loss in 7 days at 4 and 23 °C in dark	<a href="#">2334</a>	C
Tobramycin sulfate	GNS	800 mg	PHU 2 g	<a href="#">a</a>	Physically compatible. Little linezolid loss in 7 days at 4 and 23 °C in dark. No tobramycin loss in 7 days at 4 °C but losses of 4% in 1 day and 12% in 3 days at 23 °C	<a href="#">2332</a>	C
Trimethoprim-sulfamethoxazole	ES	800 mg <sup>b</sup>	PHU 2 g	<a href="#">a</a>	A large amount of white needle-like crystals forms immediately	<a href="#">2333</a>	I

<sup>a</sup>Admixed in the linezolid infusion container.

<sup>b</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

## Lorazepam - AHFS 28:24.08

**Products** — Lorazepam is available in 2- and 4-mg/mL concentrations in 1- and 10-mL vials. The 2-mg/mL concentration is also available in 0.5- and 1-mL disposable syringe cartridges, and the 4-mg/mL concentration is available in 1-mL syringe cartridges. Each milliliter also contains 0.18 mL of polyethylene glycol 400 and 2% benzyl alcohol in propylene glycol. <sup>(1-4/07)</sup>

For intramuscular use, lorazepam may be injected as is. For intravenous use, however, lorazepam *must* be diluted immediately prior to injection with an equal volume of compatible diluent. To dilute the dose in a syringe cartridge or when aspirated from a vial into a syringe, first eliminate all air and then aspirate the proper volume of diluent. Pull the plunger back slightly to provide some mixing space and gently invert the syringe cartridge or syringe repeatedly to mix the contents. To avoid air entrapment, do not shake vigorously. <sup>(1-4/07)</sup>

**Trade Name(s)** — Ativan

**Administration** — Lorazepam may be administered by deep intramuscular injection or by intravenous injection when diluted immediately before use with an equal volume of compatible diluent. Intravenous injection is made directly into a vein or into the tubing of a running intravenous infusion at a rate not exceeding 2 mg/min. Care should be taken to ensure that intra-arterial administration and perivascular infiltration will not occur. <sup>(1-4/07) (4)</sup>

**Stability** — Intact vials of lorazepam should be refrigerated and protected from light and freezing. <sup>(1-4/07) (4)</sup> The manufacturer has stated that the product may be stored for up to two weeks at room temperature. <sup>(1181)</sup> However, manufacturers have acknowledged that both physical and chemical stability are acceptable for 60 to 90 days at room temperature. <sup>(1674) (2829)</sup> Lorazepam should be inspected and should not be used if it is discolored or contains a precipitate. <sup>(1-4/07) (4)</sup>

**Precipitation** — The choice of commercial lorazepam concentration to use in the preparation of dilutions is a critical factor in the physical stability of the dilutions. Both the 2- and 4-mg/mL concentrations utilize the same concentrations of solubilizing solvents. On admixture, the solvents that keep the aqueous insoluble lorazepam in solution are diluted twice as much using the 4-mg/mL concentration than if the 2-mg/mL were used, resulting in different precipitation potentials for the same concentration of lorazepam. Care should be taken to ensure that the compounding procedure that is to be used for lorazepam admixtures has been demonstrated to result in solutions in which the lorazepam remains soluble.

Lorazepam concentrations up to 0.08 mg/mL have been reported to be physically stable, while occasional precipitate formation in admixtures of lorazepam 0.1 to 0.2 mg/mL has been reported. The precipitate has been observed in both containers and in administration set tubing. <sup>(1943) (1979) (1980)</sup> In one case, a visible precipitate formed in a lorazepam 0.5-mg/mL admixture in sodium chloride 0.9% in a glass bottle. <sup>(1945)</sup> However, a 0.5-mg/mL concentration may remain in solution longer if prepared from the 2-mg/mL concentration, yielding a higher concentration of organic solvents in the final admixture. <sup>(1981) (2207)</sup> Concentrations of 1 and 2 mg/mL have been reported to be physically stable for up to 24 hours as well as concentrations below 0.08 mg/mL. <sup>(1980) (2208)</sup> Concentrations in the middle range of 0.08 to 1 mg/mL may be problematic. <sup>(1980)</sup> In one report, use of lorazepam 2 mg/mL to prepare lorazepam 1-mg/mL admixtures in dextrose 5% or sodium chloride 0.9% was acceptable but use of the lorazepam 4-mg/mL concentration to prepare the same solutions resulted in almost immediate precipitation. <sup>(2207)</sup>

Lorazepam solubility in common infusion solutions has been reported (Table 1). Its solubility in sodium chloride 0.9% is approximately half that found in the other tested solutions. This result was attributed to the pH of the sodium chloride 0.9% (pH 6.3) being essentially the same as the isoelectric point of lorazepam (pH 6.4), where aqueous solubility would be the lowest. Dextrose 5%

was the best diluent for lorazepam.<sup>(787)</sup>

**Table 1. Lorazepam Equilibrium Solubility<sup>787</sup>**

Solution	Lorazepam Solubility (mg/mL)	Solution pH
Deionized water	0.054	7.09
Dextrose 5%	0.062	4.41
Ringer's injection lactated	0.055	7.21
Sodium chloride 0.9%	0.027	6.30

*Bacteriostatic Water* — Dilution of lorazepam (Wyeth) to 1 mg/mL with bacteriostatic water for injection (bacteriostat not noted), packaged in glass vials, resulted in lorazepam losses. Losses of about 10% at 4 °C and 12% at 22 °C occurred in seven days. Drug precipitated in varying periods after the first week of storage.<sup>(1840)</sup>

*Syringes* — Lorazepam (Wyeth) 2 mg/mL was packaged as 3 mL in 10-mL polypropylene infusion pump syringes (Pharmacia Deltec). About 12 to 14% loss occurred in three days and 25% loss in 10 days at 5 and 30 °C. The authors recommended not storing lorazepam in the syringes for these time periods.<sup>(1967)</sup>

Lorazepam (Wyeth) 1 mg/mL, prepared from the 2-mg/mL commercial concentration, diluted in dextrose 5% or in sodium chloride 0.9% was filled as 40 mL in 60-mL polypropylene syringes (Becton-Dickinson). The filled syringes were stored at 22 °C for 28 hours. Visual inspection found the solutions remained physically stable, and less than 3% drug loss occurred in this time period.<sup>(2208)</sup>

The physical and chemical stability of lorazepam (Wyeth-Ayerst) 0.2, 0.5, and 1 mg/mL in dextrose 5% and in sodium chloride 0.9% was evaluated when packaged in polypropylene syringes. When prepared using lorazepam 2 mg/mL, the solutions were found to be physically stable over 24 hours and chemically stable for 48 hours at room temperature. If prepared using lorazepam 4 mg/mL, the solutions consistently precipitated.<sup>(2416)</sup>

*Sorption* — Lorazepam (Wyeth) 2- and 4-mg/mL concentrations were diluted 1:1 using dextrose 5%, sodium chloride 0.9%, and water for injection. A 2-mL sample of each dilution was injected into the Y-sites of administration sets from five different manufacturers through which dextrose 5%, sodium chloride 0.9%, Ringer's injection, or Ringer's injection lactated, was flowing at rates of 30 and 125 mL/hr. No differences were found among the various infusion sets, infusion solutions, or flow rates. All effluent solutions were visually acceptable and had no loss of lorazepam.<sup>(786)</sup>

In another study, lorazepam (Wyeth) 2 mg/50 mL in dextrose 5% was delivered at rates of 600, 200, and 100 mL/hr using an infusion controller fitted with 180 or 350 cm of PVC tubing. Lorazepam loss due to sorption was greater with the longer tubing and at slower rates. Losses ranged from a high of 5% (350 cm, 100 mL/hr) to a low of 0.7% (180 cm, 600 mL/hr).<sup>(787)</sup>

In static sorption studies, lorazepam (Wyeth) 2 mg/50 mL in dextrose 5% was filled into PVC containers in the following amounts: 50 mL into 50-mL bags, 100 mL into 50-mL bags, and 100 mL into 250-mL bags. The bags were stored at 23 °C. A rapid initial loss of lorazepam occurred (about 3.9 to 5.8% in the first hour) followed by a slower, approximately constant loss after eight hours. Cumulative losses of 6 to 8% occurred in about five hours in the smaller bags with smaller bag surface area to volume ratios. The solution in the larger bags exhibited over a 10% loss in two hours.<sup>(787)</sup>

*Plasticizer Leaching* — Lorazepam (Wyeth-Ayerst) 0.1 mg/mL in dextrose 5% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24 °C.<sup>(1683)</sup>

### **Compatibility Information**

---

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Tested in Ringer's injection lactated.

<sup>f</sup>Lyophilized formulation tested.

<sup>g</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup>Concentration expressed in milligrams of phenytoin sodium equivalents (PE) per milliliter.

<sup>i</sup>Amoxicillin sodium component. Amoxicillin sodium in a 10:1 fixed-ratio concentration with clavulanic acid.

<sup>j</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>k</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

## Magnesium Sulfate - AHFS 28:12.92

**Products** — Magnesium sulfate is available in concentrations of 50, 8, 4, 2, and 1% in a variety of container sizes.<sup>(4)</sup> The 50% solution provides 500 mg/mL of magnesium sulfate (magnesium 4.06 mEq/mL). The pH of these concentrations may have been adjusted with sodium hydroxide and/or sulfuric acid.<sup>(1-7/07)</sup> (4)

Magnesium sulfate is available as 4% (40 mg/mL; 0.325 mEq/mL) and 8% (80 mg/mL; 0.65 mEq/mL) solutions in water for injection. Magnesium sulfate in dextrose 5% is available as 1% (10 mg/mL; 0.081 mEq/mL) and 2% (20 mg/mL; 0.162 mEq/mL).<sup>(1-7/07)</sup>

*pH* — Magnesium sulfate injection has a pH adjusted to 5.5 to 7.0.<sup>(1-7/07)</sup> The premixed infusion solutions have pH values in the range of 3.5 to 6.5.<sup>(17)</sup>

*Osmotic Values* — The 50% solution has a calculated osmolarity of 4060 mOsm/L.<sup>(1-7/07)</sup>

Magnesium sulfate 4 and 8% solutions in water for injection have osmolarities of 325 and 649 mOsm/L, respectively. Magnesium sulfate 1 and 2% solutions in dextrose 5% have osmolarities of 333 and 415 mOsm/L.<sup>(1-7/07)</sup>

**Administration** — Magnesium sulfate may be administered by intramuscular or direct intravenous injection and by continuous or intermittent intravenous infusion. For intravenous injection, a concentration of 20% or less should be used; the rate of injection should not exceed 1.5 mL of a 10% solution (or equivalent) per minute. For intramuscular injection, a 25 or 50% concentration is satisfactory for adults, but dilute to 20% for infants and children.<sup>(1-7/07)</sup> (4)

**Stability** — Magnesium sulfate 50% injection and magnesium sulfate 4 and 8% in water for injection or 1 and 2% in dextrose 5% should be stored at controlled room temperature and protected from freezing.<sup>(1-7/07)</sup> (4) Refrigeration of intact ampuls may result in precipitation or crystallization.<sup>(593)</sup>

### Compatibility Information

#### Solution Compatibility

##### Magnesium sulfate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	MG	AB	40 g	Physically compatible. Stable for 60 days at 0 °C	922	C
Ringer's injection, lactated	BA <sup>ab</sup>	AMR	37 g	Visually compatible. No change in composition in 3 months stored at room temperature	2184	C
Sodium chloride 0.9%	BA <sup>ab</sup>	AMR	37 g	Visually compatible. No change in composition in 3 months stored at room temperature	2184	C

<sup>a</sup>Tested in glass containers.

<sup>b</sup>Tested in PVC containers.

#### Additive Compatibility

##### Magnesium sulfate

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
------	-----	--------	-----	--------	-----------	---------	-----	-----

Amphotericin B	SQ	40 and 80 mg	IMS	2 and 4 g	D5W	Physically incompatible in 3 hr at 24 °C with decreased clarity and development of supernatant	<a href="#">1578</a>	I

Penicillin G potassium	PF	500 mg		1 g	W	5% penicillin loss in 1 day and 13% in 2 days at 24 °C	<a href="#">999</a>	C
Penicillin G potassium	PF	500 mg		2 to 8 g	W	7 to 8% penicillin loss in 1 day and 20 to 25% in 2 days at 24 °C	<a href="#">999</a>	C
Polymyxin B sulfate	BW	200 mg	LI	16 mEq	D5W	Physically incompatible	<a href="#">15</a>	I
Potassium acetate		25 mmol		10 mmol	TPN	Transient precipitate forms	<a href="#">2266</a>	?
Potassium chloride	BRN	80 mEq	DB	3.9 g	D5W, NS	Visually compatible. Under 5% loss of ions in 24 hr at 22 °C	<a href="#">2360</a>	C
Sodium bicarbonate	AB	80 mEq	LI	16 mEq	D5W	Physically incompatible	<a href="#">15</a>	I
Sodium bicarbonate	BA	50 mEq	HOS	1.5 and 15 mEq	<sup>d</sup>	Physically compatible. No loss of ions for 48 hr at 23 °C	<a href="#">2814</a>	C
Verapamil HCl	KN	80 mg	IX	10 g	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in glass containers.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>d</sup>Tested in an extemporaneously-compounded hemofiltration solution.

### Drugs in Syringe Compatibility

#### Magnesium sulfate

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Dimenhydrinate		10 mg/1 mL		500 mg/1 mL	Clear solution	<a href="#">2569</a>	C

Magnesium Sulfate - AHFS 28:12.92

## Mannitol - AHFS 40:28.12

**Products** — Mannitol is available in concentrations ranging from 5 to 25%<sup>(1-6/06)</sup> (4) :

Concentration	Osmolarity	Available Sizes
5%	275 mOsm/L	1000 mL
10%	550 mOsm/L	500 and 1000 mL
15%	825 mOsm/L	500 mL
20%	1100 mOsm/L	250 and 500 mL
25%	1375 mOsm/L	50 mL

*pH* — From 4.5 to 7.<sup>(1-6/06)</sup> (4)

*Trade Name(s)* — Osmitol

**Administration** — Mannitol is administered by intravenous infusion. An administration set with a filter should be used for infusion solutions containing mannitol 20% or more. The dosage, concentration, and administration rate are dependent on the patient's condition and response.<sup>(1-6/06)</sup> (4)

**Stability** — Mannitol solutions should be stored at controlled room temperature and protected from freezing.<sup>(1-6/06)</sup> (4) The solutions are chemically stable. Mannitol 25% was chemically and physically stable after five autoclavings at 250 °F for 15 minutes. In addition, no extracts or visible particles from the rubber closures were found.<sup>(83)</sup>

*Crystallization* — In concentrations of 15% or greater, mannitol may crystallize when exposed to low temperatures.<sup>(1-6/06)</sup> (4) (593) Do not use a mannitol solution containing crystals. If such crystallization occurs, the recommended procedure for resolubilization is to heat the mannitol in a dry heat cabinet to 70 °C for flexible plastic containers with the overwrap intact or to 80 °C for glass containers with vigorous shaking. The use of a water bath is not recommended. Mannitol 25% in glass vials may be autoclaved at 121 °C. The solution should cool to body temperature before use.<sup>(1-6/06)</sup> (4)

The use of a microwave oven to resolubilize crystallized mannitol in glass ampuls has been suggested. Exposure to microwave radiation followed by shaking satisfactorily resolubilized the crystals in a shorter total time than the water bath and autoclave methods and resulted in no chemical decomposition.<sup>(694)</sup>

Unfortunately, the use of microwave radiation to solubilize mannitol crystals is a highly risky undertaking. Explosions of mannitol ampuls during microwave exposure have been reported.<sup>(695)</sup> (697) Such explosions could injure someone as well as ruin the microwave oven. The explosion results from pressure building during the heating of the solution that occurs from the microwave exposure.<sup>(696)</sup> (697)

One inventive pharmacist redissolved mannitol crystals using a coffeemaker.<sup>(1114)</sup>

As an alternative to resolubilizing techniques, the use of warming chambers to maintain the solutions in a crystal-free condition has been recommended.<sup>(698)</sup> (699) (700) Various chambers have been described including a wooden cabinet<sup>(698)</sup>, a metal kettle<sup>(699)</sup>, and even a bun warmer.<sup>(700)</sup> Storage temperatures of 35 and 50 °C have been utilized.<sup>(698)</sup> (699)

A related but differing effect is seen when supersaturated solutions of mannitol are placed in PVC bags. Within a few minutes, a heavy white flocculent precipitate forms. The needle-like crystals in mannitol solutions result from slow undisturbed growth. The white flocculent mannitol precipitate

results from contact with the PVC surfaces, which act as nuclei for rapid crystallization of small crystals. Attempts to resolubilize the precipitate with the aid of heat are not fruitful because crystallization may recur in a short time.<sup>(432)</sup>

**Compatibility Information**

**Additive Compatibility**

**Mannitol**

## Mechlorethamine Hydrochloride (MUSTINE HYDROCHLORIDE) - AHFS 10:00

**Products** — Mechlorethamine hydrochloride is available in vials containing 10 mg of drug and sodium chloride qs 100 mg. While taking appropriate protective measures, including wearing protective gloves, reconstitute the vial with 10 mL of water for injection or sodium chloride 0.9%. With the needle in the rubber stopper, shake the vial several times to dissolve the drug. The resultant solution contains mechlorethamine hydrochloride 1 mg/mL. <sup>(1-10/05)</sup>

*pH* — The reconstituted solution has a pH of 3 to 5. <sup>(1-10/05)</sup> <sup>(4)</sup>

*Trade Name(s)* — Mustargen

**Administration** — Mechlorethamine hydrochloride is administered intravenously or into body cavities. <sup>(1-10/05)</sup> <sup>(4)</sup> The drug is extremely irritating to tissues and should not be given intramuscularly or subcutaneously. <sup>(4)</sup> For intravenous use, the drug may be injected over a few minutes directly into the vein or into the tubing of a running infusion solution. <sup>(1-10/05)</sup> <sup>(4)</sup> After administration, flushing the vein with about 5 to 10 mL of intravenous solution has been recommended. <sup>(4)</sup> The drug is a powerful vesicant, and extravasation should be avoided. <sup>(1-10/05)</sup> <sup>(4)</sup> <sup>(377)</sup> For intracavitary administration, the drug may be diluted up to 100 mL with sodium chloride 0.9%. <sup>(1-10/05)</sup> <sup>(4)</sup>

Spillage of the drug on gloves, etc., can be neutralized by soaking in an aqueous solution containing equal amounts of sodium thiosulfate 5% and sodium bicarbonate 5% for 45 minutes. Unused injection solution also may be neutralized by mixing with an equal volume of the sodium thiosulfate-sodium bicarbonate solution for 45 minutes. <sup>(1-10/05)</sup> <sup>(1200)</sup>

**Stability** — In dry form, the drug is a light yellow-brown and is stable at temperatures up to 40 °C. <sup>(4)</sup> Solutions decompose on standing and should be prepared immediately before use. The drug is even less stable in neutral or alkaline solutions than in the acidic reconstituted solution. Do not use if the solution is discolored or if water droplets form within the vial before reconstitution. Discard unused portions after neutralization. <sup>(1-10/05)</sup> <sup>(4)</sup>

Because of the rapid decomposition of mechlorethamine hydrochloride in solution, administration in intravenous infusion solutions is not recommended. <sup>(4)</sup> One report indicated a 7% loss of mechlorethamine in one hour at room temperature when diluted to 0.1 mg/mL in sodium chloride 0.9%. <sup>(923)</sup> Injecting the drug into the tubing of a running intravenous infusion rather than adding it to the entire volume of the solution minimizes the extent of chemical decomposition. <sup>(1-10/05)</sup>

The stability of mechlorethamine hydrochloride (Boots) 1 mg/mL when reconstituted with water for injection or sodium chloride 0.9% in vials and plastic syringes was determined. About an 8 to 10% loss occurred in samples over six hours at 22 °C; losses of 4 to 6% occurred in six hours in samples stored at 4 °C. <sup>(1279)</sup>

Immersion of a needle with an aluminum component in mechlorethamine (MSD) 1 mg/mL resulted in no visually apparent reaction after seven days at 24 °C. <sup>(988)</sup>

*Freezing Solutions* — The stability of mechlorethamine hydrochloride (Boots) 1 mg/mL in water for injection and sodium chloride 0.9% frozen at -20 °C was determined. In water for injection, about a 7% loss occurred after 12 weeks; about a 15% loss occurred in eight weeks with sodium chloride 0.9% as the diluent. At a concentration of 10 mg/500 mL in sodium chloride 0.9% in PVC bags, about a 10% loss occurred in eight weeks frozen at -20 °C. <sup>(1279)</sup>

## Compatibility Information

Mechlorethamine Hydrochloride (MUSTINE HYDROCHLORIDE) - AHFS  
10:00

## Melphalan Hydrochloride - AHFS 10:00

**Products** — Melphalan hydrochloride is available in 50-mg vials with povidone 20 mg. It is packaged with a vial of special diluent containing sodium citrate 0.2 g, propylene glycol 6 mL, ethanol (96%) 0.52 mL, and sterile water for injection qs to 10 mL. While taking appropriate protective measures, including wearing protective gloves, reconstitute by rapidly injecting 10 mL of special diluent and shake vigorously to yield a 5-mg/mL melphalan concentration. <sup>(1-6/07)</sup>

*pH* — The reconstituted solution has a pH of about 7. <sup>(4)</sup>

*Trade Name(s)* — Alkeran

**Administration** — Melphalan is administered intravenously. Immediately after reconstitution, the drug should be diluted in sodium chloride 0.9% to a concentration not greater than 0.45 mg/mL. It should be infused over 15 to 20 minutes. <sup>(1-6/07)</sup> (4)

**Stability** — Intact vials should be stored at controlled room temperature and protected from light. The reconstituted solution is stable for no more than 90 minutes at room temperature. <sup>(4)</sup>  
Refrigeration of the reconstituted solution results in precipitation. <sup>(1-6/07)</sup> (4)

Because of rapid decomposition, the manufacturer recommends that drug administration be completed within 60 minutes of initial reconstitution. Degradation products are detected within 30 minutes. <sup>(1-6/07)</sup>; a 10% loss occurs within approximately three hours at 30 °C. <sup>(234)</sup> After dilution in sodium chloride 0.9%, nearly 1% of the drug is hydrolyzed every 10 minutes. <sup>(1-6/07)</sup>

*pH Effects* — Melphalan is most stable over a pH range of 3 to 7; decomposition increases at pH 9. <sup>(971)</sup>

*Sorption* — Melphalan hydrochloride (GlaxoWellcome) 60 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption in polyethylene, PVC containers, and glass containers over 24 hours under refrigeration and eight hours at room temperature. <sup>(2420)</sup> (2430)

*Filtration* — Melphalan hydrochloride 20 mcg/mL in 1 mL of sodium chloride 0.9% was filtered through the following filters; minimal adsorption occurred in all cases <sup>(970)</sup> :

Filter	Delivered Concentration (% of initial)
Cellulose acetate 0.2 µm (Minisart-N, Sartorius)	99
Polysulfone 0.45 µm (Acrodisc, Gelman)	98
Polytetrafluoroethylene 0.45 µm (Acrodisc-CR, Gelman)	96

Melphalan Hydrochloride - AHFS 10:00

## Mepivacaine Hydrochloride - AHFS 72:00

**Products** — Mepivacaine hydrochloride is available in concentrations of 1, 1.5, and 2.0%. Methylparaben is incorporated into multiple-dose containers, but single-dose containers may be preservative free. The pH may have been adjusted with sodium hydroxide and/or hydrochloric acid. <sup>(1-5/06)</sup> <sup>(4)</sup>

*pH* — From 4.5 to 6.8. <sup>(1-5/06)</sup> <sup>(4)</sup>

*Osmolality* — Mepivacaine hydrochloride injections are isotonic. <sup>(1-5/06)</sup>

*Trade Name(s)* — Carbocaine, Polocaine, Polocaine-MPF

**Administration** — Mepivacaine hydrochloride may be administered by infiltration and by peripheral or sympathetic nerve block. Mepivacaine hydrochloride *without* preservatives may be administered by epidural block, including caudal anesthesia; forms containing preservatives should not be administered by this route <sup>(4)</sup>.

**Stability** — Mepivacaine hydrochloride in intact containers should be stored at controlled room temperature and protected from temperatures above 40 °C and from freezing. Mepivacaine hydrochloride is resistant to hydrolysis and may be autoclaved repeatedly. <sup>(1-5/06)</sup> <sup>(4)</sup> However, mepivacaine hydrochloride in dental cartridges should not be subjected to autoclaving because of breakdown of the dental cartridge closures. <sup>(4)</sup>

*Syringes* — The stability of mepivacaine (salt form unspecified) 10 mg/mL repackaged in polypropylene syringes was evaluated. Little change in concentration was found after four weeks of storage at room temperature not exposed to direct light. <sup>(2164)</sup>

Mepivacaine Hydrochloride - AHFS 72:00

## Meropenem - AHFS 8:12.07.08

**Products** — Meropenem is available in dosage forms containing 500 mg and 1 g of drug along with sodium carbonate. [\(1-11/07\)](#)

Reconstitute the 500-mg vials with 10 mL and the 1-g vials with 20 mL of sterile water for injection, shake the vial, and allow it to stand until the solution is clear. Each milliliter of the resultant solution contains 50 mg of meropenem. [\(1-11/07\)](#)

*pH* — The reconstituted solution has a pH from 7.3 to 8.3. [\(1-11/07\)](#)

*Sodium Content* — Each gram of meropenem provides 3.92 mEq (90.2 mg) of sodium from the sodium carbonate present in the formulation. [\(1-11/07\)](#)

*Trade Name(s)* — Merrem

**Administration** — Meropenem is administered by direct intravenous injection of 5 to 20 mL over three to five minutes or by intravenous infusion diluted in a compatible infusion solution over 15 to 30 minutes. [\(1-11/07\)](#)

**Stability** — Intact vials should be stored at controlled room temperature between 20 and 25 °C. The drug is a white to pale yellow powder that yields a colorless to yellow solution on reconstitution. [\(1-11/07\)](#)

The manufacturer indicates that reconstituted solutions in vials of meropenem up to 50 mg/mL in sterile water for injection are stable for two hours at room temperature and up to 12 hours under refrigeration. The infusion vials diluted in sodium chloride 0.9% to a meropenem concentration of 2.5 to 50 mg/mL are stated to be stable for two hours at room temperature and 18 hours under refrigeration; in dextrose 5% at these concentrations, stability is only one hour at room temperature and eight hours under refrigeration. [\(1-11/07\)](#)

Meropenem 50 mg/mL reconstituted with sodium chloride 0.9% is reported to reach 10% loss in 4.8 hours at 25 °C. [\(2697\)](#)

Solutions of meropenem 2.5 to 20 mg/mL in sodium chloride 0.9% in the Minibag Plus (Baxter) are stable for up to four hours at room temperature and up to 24 hours under refrigeration. In dextrose 5% in the same concentration range, the drug is stable for only one hour at room temperature and up to six hours under refrigeration. [\(1-11/07\)](#)

In addition, the manufacturer notes that meropenem 1 to 20 mg/mL in sterile water for injection or sodium chloride 0.9% is stable for up to four hours and in dextrose 5% for up to two hours at room temperature in plastic administration set tubing, drip chambers, and volume control devices. [\(1-11/07\)](#)

The manufacturer notes that meropenem 1 to 20 mg/mL in sterile water for injection or sodium chloride 0.9% is stable for up to 48 hours and in dextrose 5% for up to six hours in plastic syringes stored under refrigeration. [\(1-11/07\)](#)

*Central Venous Catheter* — Meropenem (Zeneca) 5 mg/mL in sodium chloride 0.9% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. [\(2335\)](#)

Ringer's injection, lactated	BA <sup>a</sup>	ZEN	20 g	9% loss in 8 hr at 24 °C and 7% loss in 48 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>
Sodium chloride 0.45%	AB <sup>d</sup>	ZEN	5 g	9 to 10% loss in 22 hr at 24 °C and 3% loss in 48 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>
Sodium chloride 0.45%	AB <sup>d</sup>	ZEN	20 g	6 to 8% loss in 10 hr at 24 °C and 5 to 6% loss in 48 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>
Sodium chloride 0.9%	BA <sup>a</sup>	ZEN	1 g	8 to 10% loss in 20 hr at 24 °C and 3 to 4% loss in 48 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>
Sodium chloride 0.9%	BA <sup>b</sup>	ZEN	2.5 g	10% loss in 24 hr at 24 °C and 2% loss in 48 hr at 4 °C	<a href="#">2089</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	ZEN	20 g	8% loss in 10 hr at 24 °C and 5 to 7% loss in 48 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>
Sodium chloride 0.9%	BA <sup>b</sup>	ZEN	50 g	9 to 10% loss in 8 hr at 24 °C and in 48 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>
Sodium chloride 0.9%	<sup>e</sup>	ZEN	20 and 30 g	Less than 3% loss in 24 hr when kept at less than 5 °C	<a href="#">2261</a>	C
Sodium chloride 0.9%	<sup>h</sup>	ZEN	5 g	Visually compatible. Calculated times to 10% loss were 34 hr at 24 °C and 120 hr at 5 °C	<a href="#">2151</a>	C
Sodium chloride 0.9%	<sup>h</sup>	ZEN	10 g	Visually compatible. Calculated times to 10% loss were 20 hr at 24 °C and 120 hr at 5 °C	<a href="#">2151</a>	C
Sodium chloride 0.9%	<sup>a</sup>	ZEN	1 g	Visually compatible. Calculated time to 10% loss in 22 hr at 23 °C, 10.7 days at 4 °C, and 33.4 days at -20 °C	<a href="#">2492</a>	I
Sodium chloride 0.9%	<sup>a</sup>	ZEN	22 g	Visually compatible. Calculated time to 10% loss in 17 hr at 23 °C, 4.9 days at 4 °C, and 11.4 days at -20 °C	<a href="#">2492</a>	I
Sodium chloride 0.9%		ASZ	5 g	6% loss in 8 hr at 20 °C; 12% loss in 8 hr at 37 °C	<a href="#">2532</a>	C
Sodium chloride 0.9%	<sup>f</sup>	ASZ	30 g	No loss in 24 hr kept in a cold pouch with two freezer packs	<a href="#">2568</a>	C
Sodium chloride 0.9%	<sup>ag</sup>	ZEN	4 g	3 to 4% loss in 168 hr at 5 °C	<a href="#">2554</a>	C
Sodium chloride 0.9%	<sup>ag</sup>	ZEN	10 g	2 to 5% loss in 120 hr at 5 °C	<a href="#">2554</a>	C
Sodium chloride 0.9%	<sup>ag</sup>	ZEN	20 g	7% loss in 120 hr at 5 °C	<a href="#">2554</a>	C
Sodium lactate (1/6) M	BA <sup>a</sup>	ZEN	1 g	7% loss in 8 hr at 24 °C and 6 to 7% loss in 48 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>
Sodium lactate (1/6) M	BA <sup>a</sup>	ZEN	20 g	9% loss in 8 hr at 24 °C and 4 to 5% loss in 24 hr at 4 °C	<a href="#">2089</a>	I <sup>c</sup>

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in glass containers.

<sup>c</sup>Incompatible by conventional standards but recommended for dilution of meropenem with use in shorter periods of time.

<sup>d</sup>Tested in Abbott ADD-Vantage system.

<sup>e</sup>Tested in CADD-Plus medication cassettes.

<sup>f</sup>Tested in Deltec medication cassettes.

<sup>g</sup>Tested in Homepump Eclipse elastomeric pump reservoirs.

<sup>h</sup>Tested in Intermate SV elastomeric pump reservoirs.

### Additive Compatibility

Meropenem - AHFS 8:12.07.08

## Mesna - AHFS 92:56

**Products** — Mesna is available as a 100-mg/mL solution in 10-mL multidose vials. Each milliliter of solution also contains edetate disodium 0.25 mg and sodium hydroxide to adjust the pH. In addition, the multidose vials contain benzyl alcohol 10.4 mg/mL. [\(1-5/06\)](#)

*pH* — The pH of mesna injection is stated to be pH 6.5 to 7.3 or pH 7.5 to 8.5, depending on the specific product. [\(1-5/06\)](#)

*Trade Name(s)* — Mesnex

**Administration** — Mesna may be administered by intravenous injection or infusion. [\(1-5/06\)](#) <sup>(4)</sup> Infusion is usually performed over 15 to 30 minutes, but continuous infusion has also been utilized. <sup>(4)</sup> Dilution to a concentration of 20 mg/mL in a compatible solution is recommended for intravenous infusion. [\(1-5/06\)](#) <sup>(4)</sup>

**Stability** — Intact ampuls of mesna should be stored at controlled room temperature. The solution is clear and colorless [\(1-5/06\)](#) and is not light sensitive. <sup>(72)</sup> When exposed to oxygen, mesna oxidizes to the disulfide form, dimesna. Unused mesna injection in opened ampuls should be discarded after dose preparation. However, the multidose vials may be stored and used for up to eight days after initial entry. [\(1-5/06\)](#)

*pH Effects* — Mesna and ifosfamide have been found to be stable in combined admixtures <sup>(72)</sup> [\(1380\)](#) [\(1494\)](#) [\(1495\)](#) [\(1496\)](#) . However, mesna has been found to undergo more extensive decomposition when mixed with ifosfamide in an infusion solution made alkaline with sodium bicarbonate. At pH 8, mesna was stable for six hours, but lost about 13% in 24 hours and 23% in 48 hours. Ifosfamide underwent only 6% loss in 24 hours, but lost 14% in 48 hours. [\(2281\)](#)

*Syringes* — The short-term use of plastic syringes for preparing mesna infusions appears to be satisfactory. However, extended storage of mesna in a plastic and a glass syringe resulted in the formation of dark or thread-like particles and a change in viscosity after 12 hours at room temperature. <sup>(72)</sup>

Mesna (Asta Pharma) 100 mg/mL was packaged as 10 mL in 20-mL polypropylene syringes (Becton-Dickinson). Samples having the air expelled from the syringes were stored at 5, 24, and 35 °C, and samples with air drawn into the syringes were stored at 24 °C. After nine days of storage, little or no change in the mesna concentration was found in all samples with no air present. The maximum loss was less than 4% found in the samples stored at 35 °C. However, the syringes containing air exhibited 10% loss in eight days at 24 °C. Minimizing the exposure of mesna to air during storage was recommended to slow the formation of dimesna. [\(2181\)](#)

## Methadone Hydrochloride - AHFS 28:08.08

**Products** — Methadone hydrochloride is available in 20-mL multidose vials. Each milliliter of solution contains methadone hydrochloride 10 mg and sodium chloride 0.9% with sodium hydroxide and/or hydrochloric acid to adjust the pH. In addition, the 20-mL vials contain chlorobutanol 0.5%.<sup>(1-3/06)</sup>

*pH* — From 4.5 to 6.5.<sup>(1-3/06)</sup>

**Administration** — Methadone hydrochloride may be administered by subcutaneous, intramuscular, or intravenous injection.<sup>(1-3/06)</sup> (4)

**Stability** — Methadone hydrochloride in intact vials should be stored at controlled room temperature and protected from light.<sup>(1-3/06)</sup>

## Methocarbamol - AHFS 12:20.04

**Products** — Methocarbamol 100 mg/mL is available in 10-mL vials. Also present in the formulation is polyethylene glycol 300 50% in water for injection with sodium hydroxide and/or hydrochloric acid to adjust pH during manufacturing. <sup>(1-8/06)</sup>

*pH* — From 3.5 to 6.0. <sup>(1-8/06)</sup>

*Tonicity* — Methocarbamol injection is hypertonic. <sup>(4)</sup>

*Trade Name(s)* — Robaxin

**Administration** — Methocarbamol injection is administered intramuscularly or intravenously. It should not be given subcutaneously. For intramuscular injection, not more than 5 mL (500 mg) should be given into each gluteal region. Direct intravenous injection should be made slowly at a maximum rate of 3 mL (300 mg) per minute. For intravenous infusion, 1 g of methocarbamol may be diluted in 250 mL of dextrose 5% or sodium chloride 0.9%. <sup>(1-8/06)</sup>

**Stability** — Store at controlled room temperature <sup>(1-8/06)</sup> and protected from freezing. Methocarbamol was stable for up to six days when diluted in sterile water for injection, dextrose 5%, or sodium chloride 0.9% to a concentration of 4 mg/mL. Refrigeration of methocarbamol diluted for intravenous infusion to concentrations of 15.4 mg/mL and greater may result in precipitation. <sup>(4)</sup>

Methocarbamol - AHFS 12:20.04

## Methohexital Sodium - AHFS 28:04.04

**Products** — Methohexital sodium is available in 50-mL vials (with or without accompanying vials of sterile water for injection) containing methohexital sodium 500 mg with anhydrous sodium carbonate 30 mg and in vials containing methohexital sodium 2.5 g with sodium carbonate 150 mg, and in vials containing methohexital sodium 5 g with sodium carbonate 300 mg. <sup>(1-4/08)</sup>

To prepare a 1% (10 mg/mL) solution of methohexital sodium for intravenous use, reconstitute with sterile water for injection, preferably, or sodium chloride 0.9% 50 mL for the 500-mg vials or 15 mL initially and then bring to 250 mL for the 2.5-g size. Do not use diluents containing bacteriostats. <sup>(1-4/08)</sup>

The initial dilution of the 2.5-g vials results in a yellow solution. When further diluted, the solution must be clear and colorless or it should not be used. <sup>(1-4/08)</sup> (4)

To prepare a 0.2% (2 mg/mL) solution of methohexital sodium for intravenous use, add 500 mg to 250 mL of dextrose 5% or sodium chloride 0.9%. Sterile water for injection should not be used for this concentration to avoid extreme hypotonicity. <sup>(1-4/08)</sup>

To prepare a 5% (50-mg/mL) solution for intramuscular use, the 500-mg and 2.5-g vials should be reconstituted with 10 and 50 mL, respectively, of compatible diluent. <sup>(1-4/08)</sup>

*pH* — A 0.2% solution in dextrose 5% has a pH of 9.5 to 10.5; a 1% solution in sterile water for injection has a pH of 10 to 11. <sup>(1-4/08)</sup> (4)

*Sodium Content* — Methohexital sodium contains 4.652 mEq of sodium per gram of drug; the sodium carbonate provides 1.132 mEq while the balance comes from the drug itself. <sup>(869)</sup>

*Trade Name(s)* — Brevital Sodium

**Administration** — Methohexital sodium is administered intravenously, by injection or continuous infusion, in concentrations no higher than 1%. Intra-arterial injection and extravasation should be avoided. Intramuscular injection of 5% solutions has also been described. <sup>(1-4/08)</sup>

Methohexital sodium is stated to be incompatible with silicone and, as a consequence, should not contact rubber stoppers or parts of disposable syringes that have been treated with silicone. <sup>(4)</sup>

**Stability** — Intact vials should be stored at controlled room temperature. <sup>(1-4/08)</sup> (4) Solutions of methohexital sodium in dextrose 5% or sodium chloride 0.9% are stable for about 24 hours. <sup>(4)</sup> The manufacturer does not recommend the use of Ringer's injection, lactated, as a diluent. The potential for incompatibility exists between the sodium carbonate in the drug formulation and the calcium ions of the infusion solution. <sup>(1-4/08)</sup> (282)

*pH Effects* — Methohexital sodium is alkaline in solution and is incompatible with acidic solutions and phenol-containing solutions. <sup>(4)</sup>

Methohexital sodium exhibits poor solubility in an acidic medium and may precipitate in solutions containing acidic drugs. <sup>(22)</sup>

Since solubility is maintained only at relatively high pH, mixing methohexital sodium with acidic solutions is not recommended. <sup>(4)</sup> Mixed with methohexital sodium, a haze or precipitate forms in 15 minutes with atropine sulfate and tubocurarine chloride, in 30 minutes with metocurine iodide and succinylcholine chloride, and in 60 minutes with scopolamine HBr. <sup>(1-4/08)</sup>

When barbiturates are mixed with succinylcholine chloride, either free barbiturate precipitates or the

succinylcholine chloride is hydrolyzed, depending on the final pH of the admixture.<sup>(4)</sup> <sup>(21)</sup> Similarly, atracurium besylate may be inactivated by alkaline solutions, such as barbiturates, and a free acid of the admixed drug may precipitate, depending on the resultant pH of the admixture.<sup>(4)</sup>

Methohexital sodium may raise the pH of admixture solutions to the alkaline range and, therefore, should not be mixed with drugs that are alkali labile.<sup>(4)</sup>

*Sorption* — Methohexital sodium (Lilly) 32 mg/L displayed 7.9% sorption to a PVC plastic test strip in 24 hours.<sup>(12)</sup> However, another test did not confirm this finding. No significant loss in PVC containers and no difference between glass and PVC containers were found.<sup>(282)</sup>

## Methotrexate Sodium - AHFS 10:00

**Products** — Methotrexate sodium is available in liquid and lyophilized dosage forms.

The liquid dosage forms contain methotrexate sodium 25 mg/mL and are available in vials of various sizes from 2 to 10 mL. The products also contain sodium chloride, and the preserved products contain benzyl alcohol. The pH has been adjusted during manufacturing with sodium hydroxide and, if necessary, hydrochloric acid. <sup>(1-8/07)</sup> <sup>(4)</sup>

Methotrexate (as the sodium salt) is available in single-use lyophilized vials containing 1 g. The pH has been adjusted during manufacturing with sodium hydroxide. The 1-g vial requires 19.4 mL of sterile, preservative-free diluent for reconstitution to yield a 50-mg/mL concentration. <sup>(4)</sup>

*pH* — The pH of the commercially available dosage forms of methotrexate sodium is approximately 8.5 (range 7.5 to 9). <sup>(1-8/07)</sup> <sup>(4)</sup>

*Tonicity* — The liquid forms of methotrexate sodium are isotonic. <sup>(1-8/07)</sup> <sup>(4)</sup>

*Sodium Content* — Methotrexate sodium liquid injections contain sodium 0.43, 0.86, and 2.15 mEq in the 2-, 4-, and 10-mL sizes, respectively. The lyophilized product contains 7 mEq of sodium in the 1-g vial. <sup>(1-8/07)</sup>

**Administration** — Methotrexate sodium may be administered by intramuscular, intra-arterial, or intrathecal injection, by direct intravenous injection, or by continuous or intermittent intravenous infusion. <sup>(1-8/07)</sup> <sup>(4)</sup> For intrathecal injection, a preservative-free form is diluted to a 1-mg/mL concentration in sodium chloride 0.9%, Elliott's B solution, or the patient's own spinal fluid. <sup>(4)</sup> <sup>(435)</sup> <sup>(830)</sup> For high-dose regimens, it is recommended that preservative-free forms of methotrexate sodium be used <sup>(241)</sup> <sup>(242)</sup>; high doses of methotrexate sodium require leucovorin rescue. <sup>(4)</sup>

**Stability** — Store the lyophilized powder and injection at controlled room temperature with protection from light. <sup>(1-8/07)</sup> <sup>(4)</sup>

For intrathecal injection, the preservative-free dosage forms should be diluted immediately prior to use. <sup>(4)</sup> Although reconstitution of the lyophilized vials immediately prior to use is also recommended because of the absence of antibacterial preservatives, the reconstituted solution is stable for at least one week at room temperature. <sup>(234)</sup>

Immersion of a needle with an aluminum component in methotrexate sodium (Lederle) 25 mg/mL resulted in the formation of orange crystals on the aluminum surface after 36 hours at 24 °C with protection from light. <sup>(988)</sup>

*pH Effects* — Methotrexate is most stable between pH 6 and 8. Drugs producing extremes of pH should not be added to methotrexate. <sup>(1072)</sup> <sup>(1369)</sup> <sup>(1379)</sup>

*Freezing Solutions* — Methotrexate sodium (Lederle) 50 mg/100 mL in PVC bags of dextrose 5% (Travenol) was frozen at -20 °C for at least 30 days and thawed by microwave radiation for two minutes with no significant change in concentration. Even after five repetitions of the freeze-thaw treatment, the methotrexate concentration showed no significant change. <sup>(818)</sup>

The stability of methotrexate 5 mg, 50 mg, and 1 g in 50 mL of sodium chloride 0.9% in PVC bags frozen at -20 °C for up to 12 weeks and thawed in a microwave oven was evaluated. No loss was found in any of the concentrations. <sup>(1281)</sup>

*Light Effects* — Photolability, although unrecognized for many years, is a stability problem that is

increased by dilution and mixture with sodium bicarbonate. <sup>(1202)</sup>

In dilute solutions of 0.1 mg/mL, methotrexate is reported to undergo photodegradation on exposure to light. Decomposition of 5 to 8% in 10 days and 11 to 17% in 20 days has been reported. This effect was not observed in the more concentrated solutions of the commercial preparation (25 mg/mL) <sup>(433)</sup> or in admixtures of methotrexate during short-term light exposure. No significant loss of methotrexate occurred due to light exposure for four hours in solutions composed of 5 mg, 50 mg, or 1 g of methotrexate in 50 mL of sodium chloride 0.9% in PVC containers. <sup>(1281)</sup>

Little methotrexate loss was found from a 1-mg/mL solution in sodium chloride 0.9% in three burette drip chambers made of cellulose propionate (Avon A200 standard and A2000 Amberset) and methacrylate butadiene styrene (Avon A2001 Sureset) when exposed to normal mixed daylight and fluorescent lighting conditions for 24 hours. However, in 48 hours about 10 and 12% losses were observed in the A200 and A2001, respectively. With exposure to direct sunlight, an 11% loss occurred in the A200 in seven hours. No loss occurred when the Amberset or Sureset was wrapped in foil and exposed to either light condition for 48 hours. <sup>(1378)</sup>

Exposure of methotrexate 1-mg/mL solution in PVC and polybutadiene tubing to mixed daylight and fluorescent light produced significant losses after eight to 12 hours. The Amberset PVC tubing or foil wrapping for the polybutadiene tubing to protect solutions from light reduced losses to 12 to 16% in 48 hours. <sup>(1378)</sup>

Methotrexate sodium (R. Bellon), reconstituted to a concentration of 1 mg/mL with sodium chloride 0.9%, was evaluated for stability in translucent containers (Perfupack, Baxter) and five opaque containers [green PVC Opafuseur (Bruneau), white EVA Perfu-opaque (Baxter), orange PVC PF170 (Cair), white PVC V86 (Codan), and white EVA Perfecran (Fandre)] when exposed to sunlight for 28 days. Photodegradation was found after storage in the translucent Perfupack. Losses ranged from 18.5 to 27% after 24 hours at a methotrexate sodium concentration of 5 mg/mL. At 1 mg/mL, losses of 4% or less occurred in 24 hours in the opaque containers. <sup>(1750)</sup>

*Intrathecal Injections* — In a study of intrathecal injections, preservative-free methotrexate sodium (Ben Venue) was reconstituted to a concentration of 2.5 mg/mL with Elliott's B solution (305 mOsm/kg, pH 7.2), sodium chloride 0.9% injection (303 mOsm/kg, pH 7.6), or Ringer's injection, lactated (270 mOsm/kg, pH 7.6). In all three solutions, methotrexate exhibited no change in concentration over seven days under fluorescent light at 30 °C. <sup>(327)</sup>

In another study, the stability and compatibility of cytarabine (Upjohn), methotrexate (National Cancer Institute), and hydrocortisone (Upjohn), mixed together in intrathecal injections, were evaluated. Two combinations were tested: (1) cytarabine 50 mg, methotrexate 12 mg (as the sodium salt), and hydrocortisone 25 mg (as the sodium succinate salt); and (2) cytarabine 30 mg, methotrexate 12 mg (as the sodium salt), and hydrocortisone 15 mg (as the sodium succinate salt). Each drug combination was added to 12 mL of Elliott's B solution (National Cancer Institute), sodium chloride 0.9% (Abbott), dextrose 5% (Abbott), and Ringer's injection, lactated (Abbott), and stored for 24 hours at 25 °C. Cytarabine and methotrexate were both chemically stable, with no drug loss after the full 24 hours in all solutions. Hydrocortisone was also stable in the sodium chloride 0.9%, dextrose 5%, and Ringer's injection, lactated, with about a 2% drug loss. However, in Elliott's B solution, hydrocortisone was significantly less stable, with a 6% loss in the 25-mg concentration over 24 hours. The 15-mg concentration was worse, with a 5% loss in 10 hours and a 13% loss in 24 hours. The higher pH of Elliott's B solution and the lower concentration of hydrocortisone may have been factors in this increased decomposition. All mixtures were physically compatible during this study, but a precipitate formed after several days of storage. <sup>(819)</sup>

Methotrexate sodium (Lederle) 2 mg/mL diluted in Elliott's B solution (Orphan Medical) was packaged as 20 mL in 30-mL glass vials and 20-mL plastic syringes (Becton Dickinson) with Red Cap (Burron) Luer-Lok syringe tip caps. The solution was physically compatible and chemically stable exhibiting little loss during storage for 48 hours at 4 and 23 °C. <sup>(1976)</sup>

Bacterially contaminated intrathecal solutions can pose very grave risks. Consequently, intrathecal solutions should be administered as soon as possible after preparation. <sup>(328)</sup>

*Syringes* — Methotrexate (Lederle) 50 mg/mL was stable for up to eight months when stored in Monoject or Plastipak plastic syringes at 25 °C. Because of possible alteration in water vapor permeability, use of Sabre and Steriseal plastic syringes is limited to 70 days at 25 °C. <sup>(1280)</sup>

Methotrexate sodium (Lederle) 2.5 mg/mL was repackaged into 10-mL plastic syringes (Becton Dickinson) and stored at 4 and 25 °C for seven days. No loss of methotrexate was found. Furthermore, no contaminants from the syringes were observed. <sup>(1913)</sup>

*Sorption* — Methotrexate sodium 22.5 mg/100 mL and 12 g/500 mL in both dextrose 5% and sodium chloride 0.9% in PVC containers (Macroflex, Macopharma) exhibited no sorption loss during 30 days of storage at 4 °C protected from light. Simulated infusion of methotrexate sodium 2.25 g/500 mL in dextrose 5% and sodium chloride 0.9% over 24 hours through opaque PVC infusion sets (Perfecran, Fandre) also showed no sorption loss to the PVC tubing. <sup>(1867)</sup>

Methotrexate sodium (Medac) 0.36 mg/mL in dextrose 5% and in sodium chloride 0.9% exhibited little or no loss due to sorption in polyethylene, PVC, and glass containers over 72 hours at room and refrigeration temperatures. <sup>(2420) (2430)</sup>

*Central Venous Catheter* — Methotrexate sodium (Immunex) 2.5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

Methotrexate Sodium - AHFS 10:00

# Methotrimeprazine Hydrochloride (LEVOMEPRMAZINE HYDROCHLORIDE) - AHFS 28:24.92

**Products** — Methotrimeprazine hydrochloride is available in 1-mL ampuls as a 25-mg/mL (2.5% w/v) solution. The injection also contains ascorbic acid, sodium sulfite, and sodium chloride in water for injection. [\(38\)](#) [\(115\)](#)

*pH* — From 3 to 5. [\(17\)](#)

*Osmolality* — Methotrimeprazine hydrochloride injection is an isotonic solution. [\(38\)](#) [\(115\)](#)

*Trade Name(s)* — Nozinan

**Administration** — Methotrimeprazine hydrochloride is administered by intramuscular injection or intravenously after dilution with an equal volume of sodium chloride 0.9% immediately before use. It may also be given by continuous subcutaneous infusion diluted with the appropriate volume of sodium chloride 0.9%. [\(38\)](#) [\(115\)](#)

**Stability** — Methotrimeprazine hydrochloride injection is a clear, colorless solution. It should be stored at controlled room temperature and protected from light. On exposure to light, methotrimeprazine hydrochloride rapidly develops a pink or yellow discoloration; discolored solutions should be discarded. The drug is incompatible with alkaline solutions. [\(38\)](#) [\(115\)](#)

## Methyldopate Hydrochloride - AHFS 24:08.16

**Products** — Methyldopate hydrochloride 50 mg/mL is available in 5- and 10-mL vials. Each milliliter of solution also contains citric acid, anhydrous 5 mg, sodium bisulfite 3.2 mg, monothioglycerol 2 mg, methylparaben 1.5 mg, sodium edetate 0.5 mg, propylparaben 0.2 mg, and sodium hydroxide and/or hydrochloric acid to adjust pH in water for injection. <sup>(1-12/02)</sup>

*pH* — From 3 to 4.2. <sup>(17)</sup>

**Administration** — Methyldopate hydrochloride is administered by intravenous infusion. Intramuscular and subcutaneous injections are not recommended due to erratic absorption. It is recommended that the desired dose be added to 100 mL of dextrose 5%. Alternatively, the dose may be administered at 100 mg/10 mL in dextrose 5%. The dose should be infused slowly over 30 to 60 minutes. <sup>(1-12/02)</sup> (4)

**Stability** — Intact vials should be stored at controlled room temperature and protected from freezing. <sup>(1-12/02)</sup> (4) In aqueous solutions, the drug is most stable at acid to neutral pH. Oxidation of the catechol ring is the most important degradation process. The rate of such oxidation increases with increasing oxygen supply, increasing pH, and decreasing drug concentration. <sup>(1072)</sup>

The pH of infusion solutions containing methyldopate hydrochloride tends to be 7 or less, even when alkaline intravenous infusion solutions are used. <sup>(4)</sup> It has been suggested that drugs poorly soluble in acidic media, such as barbiturate salts, be mixed cautiously with methyldopate hydrochloride since its acidity imparts some buffer capacity to intravenous admixtures. Furthermore, it should not be used with drugs known to be acid labile. <sup>(23)</sup>

Methyldopate hydrochloride oxidation is facilitated in alkaline solutions, yielding inactive dark-colored compounds. <sup>(23)</sup> <sup>(436)</sup> At pH 7.8, more than a 5% loss occurred over 24 hours. <sup>(437)</sup>

Methyldopate Hydrochloride - AHFS 24:08.16

## Methylergonovine Maleate - AHFS 76:00

**Products** — Methylergonovine maleate 0.2 mg/mL is available in 1-mL ampuls. Each milliliter of solution also contains maleic acid 0.1 mg and sodium chloride 7 mg in water for injection. <sup>(1-8/06)</sup>

*pH* — From 2.7 to 3.5. <sup>(17)</sup>

*Trade Name(s)* — Methergine

**Administration** — Methylergonovine maleate may be administered intramuscularly or, in severe or life-threatening situations, intravenously slowly over no less than one minute. <sup>(1-8/06)</sup> <sup>(4)</sup> Dilution of the dose to 5 mL with sodium chloride 0.9% has also been recommended for intravenous injection. <sup>(4)</sup>

**Stability** — Methylergonovine maleate injection is a clear, colorless solution. If the product becomes discolored, it should not be used. <sup>(1-8/06)</sup> <sup>(4)</sup> The drug darkens with age and exposure to light. <sup>(4)</sup> The manufacturer recommends storage of intact ampuls below 25 °C and protection from light. <sup>(1-8/06)</sup>

### Compatibility Information

Methylergonovine Maleate - AHFS 76:00

## Methylprednisolone Acetate - AHFS 68:04

**Products** — Methylprednisolone acetate is an injectable suspension that is available in 20-, 40-, and 80-mg/mL concentrations in 5- and 10-mL multiple-dose vials. Each milliliter contains<sup>(1-3/03)</sup> :

Component	Concentration/mL		
Methylprednisolone acetate	20 mg	40 mg	80 mg
Polyethylene glycol 3350	29.5 mg	29.1 mg	28.2 mg
Polysorbate 80	1.97 mg	1.94 mg	1.88 mg
Monobasic sodium phosphate	6.9 mg	6.8 mg	6.59 mg
Dibasic sodium phosphate	1.44 mg	1.42 mg	1.37 mg
Benzyl alcohol	9.3 mg	9.16 mg	8.88 mg
Sodium chloride	to adjust tonicity	to adjust tonicity	to adjust tonicity
Sodium hydroxide and/or hydrochloric acid	qs	qs	qs

Methylprednisolone acetate is also available at concentrations of 40- and 80-mg/mL in 1-mL single-dose vials. Each milliliter contains<sup>(1-3/03)</sup> :

Component	Concentration/mL	
Methylprednisolone acetate	40 mg	80 mg
Polyethylene glycol 3350	29 mg	28 mg
Myristyl-gamma-picolinium chloride	0.195 mg	0.189 mg
Sodium chloride	to adjust tonicity	to adjust tonicity
Sodium hydroxide and/or hydrochloric acid	qs	qs

*pH* — From 3.5 to 7.0.<sup>(1-3/03)</sup>

*Trade Name(s)* — Depo-Medrol

**Administration** — Methylprednisolone acetate is administered by intramuscular, intra-articular, intrasynovial, soft tissue, and intralesional injection without dilution. The drug is a suspension that must not be administered intravenously.<sup>(1-3/03)</sup>

**Stability** — The intact vials should be stored at controlled room temperature.<sup>(1-3/03)</sup>

### Compatibility Information

## Methylprednisolone Sodium Succinate - AHFS 68:04

**Products** — Methylprednisolone sodium succinate is available in 40-mg (1 mL), 125-mg (2 mL), 500-mg (4 mL), and 1-g (8 mL) dual-chamber containers and 500-mg (8 mL), 1-g (16 mL), and 2-g (30.6 mL) vials with and without diluent. Monobasic sodium phosphate anhydrous, dibasic sodium phosphate dried, and lactose in the 40-mg size are also present. Use only the special diluent or bacteriostatic water for injection with benzyl alcohol to reconstitute the vials. The reconstituted solutions contain the methylprednisolone equivalent (as sodium succinate) of 40, 62.5, 125, or 65.4 mg/mL depending on the vial size and reconstitution volume used.<sup>(1-7/04)</sup>

*pH* — The pH is adjusted to 7 to 8.<sup>(1-7/04)</sup> (4)

*Osmolarity* — The osmolarities of the 40-, 62.5-, 125-, and 65.4-mg/mL concentrations are 500, 400, 440, and 420 mOsm/L, respectively.<sup>(1-7/04)</sup>

The osmolality of methylprednisolone sodium succinate was calculated for the following dilutions<sup>(1054)</sup> :

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>500 mg</b>		
Dextrose 5%	291	275
Sodium chloride 0.9%	317	301
<b>1 g</b>		
Dextrose 5%	318	292
Sodium chloride 0.9%	345	319

*Sodium Content* — Each gram of methylprednisolone sodium succinate contains 2.01 mEq of sodium.<sup>(846)</sup>

*Trade Name(s)* — A-MethaPred, Solu-Medrol

**Administration** — Methylprednisolone sodium succinate may be administered by intramuscular and direct intravenous injection and by intermittent or continuous intravenous infusion.<sup>(1-7/04)</sup> (4) Direct intravenous injection should be performed over at least one minute<sup>(4)</sup> or over several minutes. High-dose therapy is given intravenously over at least 30 minutes.<sup>(1-7/04)</sup>

**Stability** — Intact vials should be stored at controlled room temperature between 20 and 25 °C and protected from light. Reconstituted solutions also should be stored between 20 and 25 °C and should be used within 48 hours.<sup>(1-7/04)</sup>

The drug is subject to both ester hydrolysis and acyl migration. Degradation products include free methylprednisolone, succinate, and methylprednisolone-17-succinate.<sup>(1072)</sup> Gross decomposition may result in insoluble free methylprednisolone.<sup>(2426)</sup> The solution should not be used unless it is clear and free of particulate matter.<sup>(4)</sup>

Methylprednisolone sodium succinate (Upjohn) diluted to a concentration of 4 mg/mL with sterile water for injection and packaged in glass vials was evaluated for stability. The samples stored at 22 °C lost 10% in 24 hours while those stored at 4 °C lost 6% in seven days and 17% in 14 days.<sup>(1938)</sup>

*pH Effects* — The minimum rate of hydrolysis occurs at pH 3.5. Between pH 3.4 and 7.4, acyl migration is the dominant effect.<sup>(1501)</sup>

*Freezing Solutions* — Reconstituted methylprednisolone sodium succinate (Upjohn) 125 mg/2 mL, when stored frozen, exhibited no loss over four weeks.<sup>(69)</sup>

When stored frozen at -20 °C, methylprednisolone sodium succinate (Upjohn) 500 mg/108 mL in sodium chloride 0.9% in PVC bags exhibited no loss after 12 months followed by microwave thawing. Furthermore, the solution was physically compatible.<sup>(1612)</sup>

*Syringes* — Methylprednisolone sodium succinate (Pharmacia & Upjohn) 10 mg/mL in sodium chloride 0.9% was packaged in 10-mL polypropylene syringes (Becton Dickinson) and 12-mL polypropylene syringes (Monoject) and stored at 5 and 25 °C. The drug solutions remained clear, and about 10% loss occurred in seven days at 25 °C and about 4% loss in 21 days at 5 °C. The losses were comparable to the drug solution stored in a glass flask, indicating sorption to syringe components did not occur.<sup>(2340)</sup>

*Central Venous Catheter* — Methylprednisolone sodium succinate (Abbott) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Methylprednisolone sodium succinate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Amino acids 4.25%, dextrose 25%	MG	UP	250 mg	No increase in particulate matter in 24 hr at 5 °C	349	C
Dextrose 5% in sodium chloride 0.45%		UP	5 to 10 g	Physically compatible for at least 4 hr	329	C
Dextrose 5% in sodium chloride 0.9%		UP	80 mg	Physically compatible for 24 hr	329	C
Dextrose 5%	AB	AB	500 mg to 1 g	Physically compatible and chemically stable for 24 hr at 25 °C	758	C
Dextrose 5%	AB	AB	1.25 g	Physically compatible for 12 hr at 25 °C. Haze from free methylprednisolone possible after 12 hr	758	I
Dextrose 5%	AB	AB	2 to 20 g	Physically compatible for 8 hr at 25 °C. Haze from free methylprednisolone possible after 8 hr	758	I
Dextrose 5%	AB	AB	30 g	Physically compatible and chemically stable for 24 hr at 25 °C	758	C
Dextrose 5%	TR <sup>a</sup>	UP	400 mg and 1.25 g	Physically compatible with 6 to 8% methylprednisolone 21-succinate ester loss in 24 hr at 24 °C	1418	C
Dextrose 5%	TR <sup>a</sup>	UP	40 mg and 2 g	Visually compatible with 4% or less loss in 48 hr at room temperature	1802	C
Dextrose 5%	BA <sup>a</sup> , BRN <sup>b</sup>	HO	125 mg	Visually compatible with little or no loss in 24 hr at 4 and 22 °C	2289	C

Ringer's injection, lactated		UP	80 mg	Physically compatible for 24 hr	<a href="#">329</a>	C
Sodium chloride 0.9%	AB	AB	500 mg to 30 g	Physically compatible and chemically stable for 24 hr at 25 °C	<a href="#">758</a>	C
Sodium chloride 0.9%	TR <sup>a</sup>	UP	40 mg	Visually compatible with 6% loss in 48 hr at room temperature	<a href="#">1802</a>	C
Sodium chloride 0.9%	TR <sup>a</sup>	UP	2 g	Visually compatible with 9% loss in 24 hr and 12% loss in 48 hr at room temperature	<a href="#">1802</a>	C
Sodium chloride 0.9%	BA <sup>a</sup> , BRN <sup>b</sup>	HO	125 mg	Visually compatible with little or no loss in 24 hr at 4 and 22 °C	<a href="#">2289</a>	C
TNA #237 <sup>c</sup>		PHU	25, 63, 125 mg	Physically compatible with no substantial change in lipid particle size. Variable assay results, but <10% change in drug concentration and <8% change in TNA components after 7 days at 4 °C, followed by 24 hr at ambient temperature and light	<a href="#">2347</a>	C
TPN #236 <sup>c</sup>		PHU	25, 63, 125 mg	Variable assay results, but less than 10% change in drug concentration and less than 12% change in TPN components after 7 days at 4 °C, followed by 24 hr at ambient temperature and light	<a href="#">2347</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polyethylene and glass containers.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

### Additive Compatibility

#### Methylprednisolone sodium succinate

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>f</sup>Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L, and also (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L, and also (3) dextrose 5% and TPN #274 (see Appendix I).

<sup>g</sup>Tested in Ringer's injection, lactated.

<sup>h</sup>Lyophilized formulation tested.

<sup>i</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>j</sup>Tested in sterile water for injection.

<sup>k</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>l</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

---

### **Additional Compatibility Information**

*Infusion Solutions* — Solution haziness was reported for methylprednisolone sodium succinate admixtures in intravenous fluids.<sup>(702) (758)</sup> Changes in the manufacturing process for bulk methylprednisolone sodium succinate powder have resulted in substantial improvements in admixture clarity and absence of the haze formation that developed previously in solutions of Solu-Medrol.<sup>(670) (702)</sup>

In a study of the turbidity produced by methylprednisolone sodium succinate (Abbott) 500 mg to 30 g/L, turbidity was substantially higher in dextrose 5% than in sodium chloride 0.9%.<sup>(758)</sup> Another important factor was the concentration of methylprednisolone sodium succinate. Turbidity was generally higher at intermediate concentrations (2 to 15 g/L) than at low (300 mg/L) or high (20 g/L) concentrations.<sup>(758)</sup>

These differences in the development of turbidity cannot be explained by simple increased ester hydrolysis due to differing pH values and drug concentrations. Rather, the solubility of free methylprednisolone in various concentrations of methylprednisolone sodium succinate has been suggested as the primary factor. The solubility of free methylprednisolone is increased as the concentration of the sodium succinate ester increases. The increased solubilization is believed to overshadow increased formation of free methylprednisolone in concentrations over 10 g/L, preventing or minimizing precipitation and turbidity. Differences in turbidity between the drug in dextrose 5% and sodium chloride 0.9% are believed to result primarily from the electrolyte content of sodium chloride 0.9% and, to a much lesser extent, the pH of the dextrose admixtures. These differences are presumed to affect the solubilizing capacity and reactivity of the ester.<sup>(758)</sup>

*Other Drugs* — The compatibility of methylprednisolone sodium succinate (Upjohn) with several drugs added to auxiliary medication infusion units has been studied. Primary admixtures were prepared by adding various drugs to dextrose 5%, dextrose 5% in sodium chloride 0.9%, and

Ringer's injection, lactated. Up to 100 mL of the primary admixture was added along with methylprednisolone sodium succinate (Upjohn) to the auxiliary medication infusion unit with the following results<sup>(329)</sup> :

<b>Methylprednisolone Sodium Succinate</b>	<b>Primary Solution</b>	<b>Result</b>
	<i>Aminophylline 500 mg/L</i>	
500 mg	D5S, D5W qs 100 mL	Clear solution for 24 hr

Methylprednisolone Sodium Succinate - AHFS 68:04

## Metoclopramide Hydrochloride - AHFS 56:32

**Products** — Metoclopramide hydrochloride is available in 2-mL ampuls and 2-, 10-, and 30-mL vials. Each milliliter of solution contains metoclopramide (as the hydrochloride) 5 mg with sodium chloride 8.5 mg and hydrochloric acid and/or sodium hydroxide, if necessary, in water for injection. <sup>(1-5/05)</sup>

*pH* — From 4.5 to 6.5. <sup>(1-5/05)</sup> Metoclopramide hydrochloride 1.25, 2.22, and 3.75 mg/mL in sodium chloride 0.9% had pH values of 4.4, 4.1, and 4.0, respectively. <sup>(2161)</sup>

*Osmolality* — The osmolality of metoclopramide hydrochloride 5 mg/mL was determined to be 280 mOsm/kg. <sup>(1233)</sup> Metoclopramide hydrochloride 1.25, 2.22, and 3.75 mg/mL in sodium chloride 0.9% had osmolalities of 285, 286, and 294 mOsm/kg, respectively. <sup>(2161)</sup>

*Trade Name(s)* — Reglan

**Administration** — Metoclopramide hydrochloride is administered by intramuscular injection, by direct intravenous injection undiluted slowly over one or two minutes for 10 mg doses of drug, or by intermittent intravenous infusion over 15 minutes diluted in 50 mL of compatible diluent for larger doses. <sup>(1-5/05)</sup> <sup>(4)</sup>

**Stability** — Metoclopramide hydrochloride injection is a clear, colorless solution; it should be stored at controlled room temperature and protected from freezing. The drug is stable over a pH range of 2 to 9. Metoclopramide hydrochloride is photosensitive; protection from light for the product during storage has been recommended. <sup>(4)</sup> However, the manufacturer no longer recommends light protection for dilutions under normal lighting conditions, stating that they may be stored up to 24 hours. <sup>(1-5/05)</sup>

*Freezing Solutions* — Undiluted metoclopramide hydrochloride (Robins) 5 mg/mL packaged as 3 mL in plastic infusion-pump syringes (MiniMed) fitted with Luer-Lok tip caps (Burron) exhibited microprecipitation that did not redissolve upon warming to room temperature when stored frozen at -20 °C for as little as one day. The precipitate was not visible with the unaided eye. Freezing is not an acceptable storage method for undiluted metoclopramide hydrochloride injection. <sup>(2001)</sup>

*Syringes* — Undiluted metoclopramide hydrochloride (Robins) 5 mg/mL was packaged as 3 mL in plastic infusion-pump syringes (MiniMed) fitted with Luer-Lok tip caps (Burron). Stored for seven days at 32 °C to simulate wearing a portable infusion pump close to the body, metoclopramide hydrochloride was physically stable and little loss occurred. At 23 °C, metoclopramide hydrochloride was physically and chemically stable for up to 60 days with little loss occurring. However, large quantities of subvisible particulates formed after that time, making the drug unsuitable for use. Stored under refrigeration at 4 °C, metoclopramide hydrochloride remained both physically and chemically stable for up to 90 days. <sup>(2001)</sup>

Metoclopramide hydrochloride (Solopak) 2.5 mg/mL in sodium chloride 0.9% packaged in polypropylene syringes (Sherwood) was physically stable and exhibited little or no loss in 24 hours stored at 4 and 23 °C. <sup>(2199)</sup>

*Central Venous Catheter* — Metoclopramide hydrochloride (Abbott) 0.5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

Meperidine HCl	DW	7.35 g	DW	150 mg	D5W, NS	Visually compatible. Little loss of drugs over 48 hr at 32 °C in light or dark	<a href="#">2253</a>	C
Meropenem	ZEN	1 and 20 g	RB	100 mg	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C
Morphine sulfate	EV	1 g	SKB	500 mg	NS <sup>b</sup>	Visually compatible. Little loss of either drug in 35 days at 22 °C and 182 days at 4 °C followed by 7 days at 32 °C	<a href="#">1939</a>	C
Morphine sulfate	EV	1 g	SKB	500 mg	D5W <sup>c</sup>	Visually compatible. 8% metoclopramide loss in 14 days at 22 °C and 98 days at 4 °C. No morphine loss	<a href="#">1939</a>	C
Multivitamins	USV	20 mL	RB	20 and 320 mg	NS	Physically compatible for 48 hr at room temperature	<a href="#">924</a>	C
Multivitamins	USV	20 mL	RB	20 and 320 mg	NS	Physically compatible for 48 hr at room temperature	<a href="#">924</a>	C
Oxycodone HCl	NAP	770 mg		1.2 g	NS, W	Visually compatible. Under 4% concentration change in 24 hr at 25 °C	<a href="#">2600</a>	C
Potassium acetate	IX	20 mEq	RB	10 and 160 mg	NS	Physically compatible for 48 hr at room temperature	<a href="#">924</a>	C
Potassium chloride	ES	30 mEq	RB	10 and 160 mg	NS	Physically compatible for 48 hr at room temperature	<a href="#">924</a>	C
Potassium phosphates	IX	15 mmol	RB	10 and 160 mg	NS	Physically compatible for 48 hr at room temperature	<a href="#">924</a>	C
Tramadol HCl	AND	1.118 g	SYO	1.11 g	NS <sup>d</sup>	Visually compatible for 7 days at 25 °C protected from light	<a href="#">2701</a>	C
Tramadol HCl	AND	3.33 g	SYO	3.33 g	NS <sup>d</sup>	Visually compatible for 7 days at 25 °C protected from light	<a href="#">2701</a>	C
Verapamil HCl	KN	80 mg	RB	20 mg	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C

<sup>a</sup>Tested in Pharmacia-Deltec PVC pump reservoirs.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Tested in PCA Infusors (Baxter).

<sup>d</sup>Tested in elastomeric pump reservoirs (Baxter).

### Drugs in Syringe Compatibility

#### Metoclopramide HCl

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Aminophylline	ES	500 mg/20 mL	RB	160 mg/32 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C

Aminophylline	ES	80 mg/3.2 mL	RB	10 mg/2 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C
Aminophylline	ES	500 mg/20 mL	RB	10 mg/2 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C
Ampicillin sodium	BR	250 mg/2.5 mL	RB	10 mg/2 mL	Incompatible. If mixed, use immediately	<a href="#">1167</a>	I
Ampicillin sodium	BR	1 g/10 mL	RB	10 mg/2 mL	Incompatible. If mixed, use immediately	<a href="#">1167</a>	I
Ampicillin sodium	BR	1 g/10 mL	RB	160 mg/32 mL	Incompatible. If mixed, use immediately	<a href="#">1167</a>	I
Ascorbic acid	AB	250 mg/0.5 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Ascorbic acid	AB	250 mg/0.5 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Atropine sulfate	GL	0.4 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Benztropine mesylate	MSD	2 mg/2 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Benztropine mesylate	MSD	2 mg/2 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Bleomycin sulfate		1.5 units/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Butorphanol tartrate	BR	4 mg/2 mL	NO	10 mg/2 mL	Physically compatible for 30 min at room temperature	<a href="#">566</a>	C
Caffeine citrate		20 mg/1 mL	ES	5 mg/1 mL	Visually compatible for 4 hr at 25 °C	<a href="#">2440</a>	C
Calcium gluconate	ES	1 g/10 mL	RB	10 mg/2 mL	Possible precipitate formation	<a href="#">924</a>	I
Calcium gluconate	ES	1 g/10 mL	RB	160 mg/32 mL	Incompatible. If mixed, use immediately	<a href="#">1167</a>	I
Chloramphenicol sodium succinate	PD	250 mg/2.5 mL	RB	10 mg/2 mL	White precipitate forms immediately at 25 °C	<a href="#">1167</a>	I
Chloramphenicol sodium succinate	PD	2 g/20 mL	RB	10 mg/2 mL	White precipitate forms immediately at 25 °C	<a href="#">1167</a>	I
Chloramphenicol sodium succinate	PD	2 g/20 mL	RB	160 mg/32 mL	White precipitate forms immediately at 25 °C	<a href="#">1167</a>	I
Chlorpromazine HCl	MB	25 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Cisplatin		0.5 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Cyclophosphamide		10 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Cyclophosphamide	MJ	1 g/50 mL	RB	10 mg/2 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C
Cyclophosphamide	MJ	1 g/50 mL	RB	160 mg/32 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C

Cyclophosphamide	MJ	40 mg/2 mL	RB	10 mg/2 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C
Cytarabine	UP	500 mg/10 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Cytarabine	UP	50 mg/1 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Dexamethasone sodium phosphate	ES, MSD	8 mg/2 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Dexamethasone sodium phosphate	ES, MSD	8 mg/2 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Diamorphine HCl	MB	10, 25, 50 mg/1 mL	BK	5 mg/1 mL	Physically compatible and diamorphine stable for 24 hr at room temperature	<a href="#">1454</a>	C
Diamorphine HCl	EV	50 and 150 mg/1 mL	LA	5 mg/1 mL	Slight discoloration with 8% metoclopramide loss and 9% diamorphine loss in 7 days at room temperature	<a href="#">1455</a>	C
Dimenhydrinate	HR	50 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Diphenhydramine HCl	PD	50 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Diphenhydramine HCl	PD	40 mg/4 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Diphenhydramine HCl	PD	200 mg/20 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Diphenhydramine HCl	PD	50 mg/5 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Diphenhydramine HCl	PD	250 mg/25 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Doxorubicin HCl		1 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Doxorubicin HCl	AD	90 mg/45 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Doxorubicin HCl	AD	40 mg/20 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Droperidol	MN	2.5 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Droperidol		1.25 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Fentanyl citrate	MN	0.05 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Fentanyl citrate with midazolam HCl	DB RC	1 mg/20 mL 15 mg/3 mL	AST	20 mg/4 mL	Visually compatible with 7% or less loss of each drug in 10 days at 32 °C	<a href="#">2268</a>	C

Fluorouracil		25 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Furosemide		5 mg/0.5 mL		2.5 mg/0.5 mL	Precipitates immediately	<a href="#">980</a>	I
Heparin sodium		500 units/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Heparin sodium		2500 units/1 mL		10 mg/2 mL	Physically compatible for at least 5 min	<a href="#">1053</a>	C
Heparin sodium	ES	16,000 units/16 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Heparin sodium	ES	2000 units/2 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Heparin sodium	ES	4000 units/4 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Hydromorphone HCl	KN	10 and 20 mg/mL	RB	5 mg/mL	Visually compatible with less than 10% loss of either drug in 7 days at 8 °C	<a href="#">668</a>	C
Hydroxyzine HCl	PF	50 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Leucovorin calcium		5 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Lidocaine HCl	ES	50 mg/5 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Lidocaine HCl	ES	100 mg/10 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Lidocaine HCl	ES	50 mg/5 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Lidocaine HCl	ES	100 mg/10 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Magnesium sulfate	ES	1 g/2 mL	RB	160 mg/32 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Magnesium sulfate	ES	500 mg/1 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Magnesium sulfate	ES	1 g/2 mL	RB	10 mg/2 mL	Physically compatible for 48 hr at 25 °C	<a href="#">1167</a>	C
Meperidine HCl	WI	50 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Meperidine HCl	DW	50 mg/1 mL	DW	10 mg/2 mL	Visually compatible. Little loss of either drug over 48 hr at 32 °C in light or dark	<a href="#">2253</a>	C
Methotrexate sodium		12.5 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Methotrexate sodium	LE	200 mg/8 mL	RB	160 mg/32 mL	Incompatible. If mixed, use immediately	<a href="#">1167</a>	I

Methotrexate sodium	LE	50 mg/2 mL	RB	10 mg/2 mL	Incompatible. If mixed, use immediately	<a href="#">1167</a>	I
Methotrimeprazine HCl	RP	10 mg/2 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Methylprednisolone sodium succinate	ES	250 mg/4 mL	RB	160 mg/32 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C
Methylprednisolone sodium succinate	ES	62.5 mg/1 mL	RB	10 mg/2 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C
Methylprednisolone sodium succinate	ES	250 mg/4 mL	RB	10 mg/2 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1167</a>	C
Midazolam HCl	RC	5 mg/1 mL	RB	10 mg/2 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Midazolam HCl with fentanyl citrate	RC DB	15 mg/3 mL 1 mg/20 mL	AST	20 mg/4 mL	Visually compatible with 7% or less loss of each drug in 10 days at 32 °C	<a href="#">2268</a>	C
Mitomycin		0.25 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Morphine sulfate	AH	10 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Morphine sulfate	EV	1 mg/mL	SKB	0.5 mg/mL	Diluted with NS. 5% or less loss of both drugs in 35 days at 22 °C and 182 days at 4 °C followed by 7 days at 32 °C	<a href="#">1939</a>	C
Morphine sulfate	ME	25 mg/mL <sup>b</sup>	RB	5 mg/mL	Visually compatible with less than 10% drug loss in 7 days at 8 °C	<a href="#">668</a>	C
Ondansetron HCl	GW	1 mg/mL <sup>c</sup>	SO	2.5 mg/mL <sup>c</sup>	Physically compatible. Under 6% ondansetron and under 5% metoclopramide losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Oxycodone HCl	NAP	200 mg/20 mL		100 mg/20 mL	Visually compatible. Under 4% concentration change in 24 hr at 25 °C	<a href="#">2600</a>	C
Pantoprazole sodium	<a href="#">a</a>	4 mg/1 mL		5 mg/1 mL	Precipitates within 15 min	<a href="#">2574</a>	I
Penicillin G potassium	SQ	250,000 units/1 mL	RB	10 mg/2 mL	Incompatible. If mixed, use immediately	<a href="#">924</a> <a href="#">1167</a>	I
Penicillin G potassium	SQ	1 million units/4 mL	RB	10 mg/2 mL	Incompatible. If mixed, use immediately	<a href="#">924</a> <a href="#">1167</a>	I
Pentazocine lactate	WI	30 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Prochlorperazine edisylate	MB	10 mg/2 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Promethazine HCl	WY	25 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C

Ranitidine HCl	GL	50 mg/2 mL	RB	10 mg/1 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Scopolamine HBr	ST	0.4 mg/1 mL	NO	10 mg/2 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Sodium bicarbonate	AB	100 mEq/100 mL	RB	10 mg/2 mL	Gas evolves	<a href="#">1167</a>	I
Sodium bicarbonate	AB	100 mEq/100 mL	RB	160 mg/32 mL	Gas evolves	<a href="#">1167</a>	I
Vinblastine sulfate		0.5 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C
Vincristine sulfate		0.5 mg/0.5 mL		2.5 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	<a href="#">980</a>	C

<sup>a</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>b</sup>Tested in sterile water for injection.

<sup>c</sup>Tested in sodium chloride 0.9%.

### Y-Site Injection Compatibility (1:1 Mixture)

#### Metoclopramide HCl

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Acetaminophen	CAD	10 mg/mL	HOS	5 mg/mL	Physically compatible with less than 10% acetaminophen loss over 4 hr at room temperature	<a href="#">2841</a> <a href="#">2844</a>	C
Acyclovir sodium	BW	5 mg/mL <sup>a</sup>	ES	0.2 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 25 °C	<a href="#">1157</a>	C
Acyclovir sodium	BV	5 mg/mL <sup>b</sup>	SIC	5 mg/mL	Crystals form	<a href="#">2794</a>	I
Aldesleukin	CHI	33,800 I.U./mL <sup>a</sup>	DU	5 mg/mL	Visually compatible with little or no loss of aldesleukin activity	<a href="#">1857</a>	C
Allopurinol sodium	BW	3 mg/mL <sup>b</sup>	DU	5 mg/mL	Heavy white precipitate forms immediately	<a href="#">1686</a>	I
Amifostine	USB	10 mg/mL <sup>a</sup>	ES	5 mg/mL	Physically compatible for 4 hr at 23 °C	<a href="#">1845</a>	C
Amphotericin B cholesteryl sulfate complex	SEQ	0.83 mg/mL <sup>a</sup>	FAU	5 mg/mL	Gross precipitate forms	<a href="#">2117</a>	I
Amsacrine	NCI	1 mg/mL <sup>a</sup>	RB	2.5 mg/mL <sup>a</sup>	Orange turbidity becomes orange precipitate in 1 hr	<a href="#">1381</a>	I

Aztreonam	SQ	40 mg/mL <sup>a</sup>	ES	5 mg/mL	Physically compatible for 4 hr at 23 °C	<a href="#">1758</a>	C
Bivalirudin	TMC	5 mg/mL <sup>a</sup>	FAU	5 mg/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2373</a>	C
Bleomycin sulfate		3 units/mL		5 mg/mL	Drugs injected sequentially in Y-site with no flush. No precipitate seen	<a href="#">980</a>	C
Ceftaroline fosamil	FOR	2.22 mg/mL <sup>abe</sup>	HOS	5 mg/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2826</a>	C
Ciprofloxacin	MI	2 mg/mL <sup>c</sup>	DU	5 mg/mL	Visually compatible for 24 hr at 24 °C	<a href="#">1655</a>	C
Ciprofloxacin	BAY	2 mg/mL <sup>b</sup>		5 mg/mL	Visually compatible. No ciprofloxacin loss in 15 min. Metoclopramide not tested	<a href="#">1934</a>	C
Cisatracurium besylate	GW	0.1, 2, 5 mg/mL <sup>a</sup>	AB	5 mg/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2074</a>	C
Cisplatin		1 mg/mL		5 mg/mL	Drugs injected sequentially in Y-site with no flush. No precipitate seen	<a href="#">980</a>	C
Cladribine	ORT	0.015 <sup>b</sup> and 0.5 <sup>d</sup> mg/mL	RB	5 mg/mL	Physically compatible for 4 hr at 23 °C	<a href="#">1969</a>	C
Clarithromycin	AB	4 mg/mL <sup>a</sup>	ANT	5 mg/mL	Visually compatible for 72 hr at both 30 and 17 °C	<a href="#">2174</a>	C
Cyclophosphamide		20 mg/mL		5 mg/mL	Drugs injected sequentially in Y-site with no flush. No precipitate seen	<a href="#">980</a>	C
Dexmedetomidine HCl	AB	4 mcg/mL <sup>b</sup>	FAU	5 mg/mL	Physically compatible for 4 hr at 23 °C	<a href="#">2383</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Tested in Ringer's injection, lactated.

<sup>f</sup>Lyophilized formulation tested.

<sup>g</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>i</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>j</sup>Quinupristin and dalfopristin components combined.

## Metoprolol Tartrate - AHFS 24:24

**Products** — Metoprolol tartrate is available in 5-mL ampuls, vials, and syringe cartridges. Each milliliter of solution contains 1 mg of metoprolol tartrate and 9 mg of sodium chloride. <sup>(1-8/08)</sup>

*pH* — From 5 to 8. <sup>(17)</sup>

*Trade Name(s)* — Lopressor

**Administration** — Metoprolol tartrate is administered intravenously. <sup>(1-8/08)</sup>

**Stability** — Metoprolol tartrate injection should be stored at controlled room temperature and protected from light and freezing. <sup>(1-8/08)</sup> (4)

Metoprolol tartrate under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38 °C over 4 weeks. Analysis found no loss of the drug under these conditions. <sup>(2562)</sup>

### Compatibility Information

#### Solution Compatibility

Metoprolol Tartrate - AHFS 24:24

## Metronidazole - AHFS 8:30.92

**Products** — Metronidazole 5 mg/mL is available as a ready-to-use solution in 100-mL (500-mg) single-dose PVC plastic bags. No dilution or buffering is required. Each bag also contains dibasic sodium phosphate 48 mg, citric acid anhydrous 23 mg, and sodium chloride 790 mg in water for injection. <sup>(1-6/08)</sup>

*pH* — Metronidazole has a pH of 5.5 (range 4.5 to 7). <sup>(1-6/08)</sup> <sup>(17)</sup>

*Osmolarity* — Metronidazole has an osmolarity of 310 mOsm/L. <sup>(1-6/08)</sup>

*Sodium Content* — Metronidazole contains 14 mEq of sodium from the excipients per 500 mg of metronidazole. <sup>(1-6/08)</sup> <sup>(4)</sup>

**Administration** — Metronidazole is administered by continuous intravenous infusion or by intermittent intravenous infusion over one hour. <sup>(1-6/08)</sup> <sup>(4)</sup>

**Stability** — Metronidazole ready-to-use is a clear, colorless solution which should be stored at controlled room temperature and protected from light. It should not be stored under refrigeration. <sup>(1-6/08)</sup> <sup>(4)</sup> Refrigeration may result in crystal formation. However, the crystals redissolve on warming to room temperature. <sup>(1115)</sup>

*Light Effects* — Prolonged exposure to light will cause a darkening of the product. <sup>(4)</sup> However, most manufacturers indicate that short-term exposure to normal room light does not adversely affect metronidazole stability. Direct sunlight should be avoided. <sup>(1115)</sup>

*Sorption* — Metronidazole was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(536)</sup> <sup>(606)</sup>

*Central Venous Catheter* — Metronidazole (Baxter) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

### Compatibility Information

#### Additive Compatibility

##### Metronidazole

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Amoxicillin sodium-clavulanate potassium	BE	20 g <sup>b</sup>	BAY	5 g		Physically compatible with 8% clavulanate loss in 2 hr and 25% loss in 6 hr at 21 °C. 7 to 8% amoxicillin and no metronidazole loss in 6 hr at 21 °C	1920	I

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Lyophilized formulation tested.

<sup>d</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>e</sup>Tested in Ringer's injection, lactated.

<sup>f</sup>Test performed using the formulation WITHOUT edetate disodium

<sup>g</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

## Mexiletine Hydrochloride - AHFS 24:04.04.08

**Products** — Mexiletine hydrochloride is available as a 25-mg/mL solution in 10-mL (250-mg) ampuls. The product also contains sodium chloride and water for injection. <sup>(38)</sup>

*Trade Name(s)* — Mexitil

**Administration** — Mexiletine hydrochloride is administered intravenously. It should never be given as a bolus. A loading dose is given by intravenous injection at a rate of 1 mL (25 mg) per minute. This is followed by intravenous infusion of a 500-mg/500 mL (1-mg/mL) dilution in a suitable infusion solution. The initial infusion rate of the first 250 mL of the admixture is 4 mL/min over the first hour followed by infusion of the next 250 mL at 2 mL/min over the next two hours. Maintenance is performed using a 250-mg/500 mL (0.5-mg/mL) dilution administered at a rate of 1 mL/min. <sup>(38)</sup>

**Stability** — Mexiletine hydrochloride injection is a clear, colorless solution that should be stored below 25 °C and protected from light. Dilutions for infusion are stable for up to eight hours. <sup>(38)</sup>

### Compatibility Information

#### Solution Compatibility

##### Mexiletine HCl

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%				Compatible for 8 hr	38	C
Sodium chloride 0.9% <sup>a</sup>				Compatible for 8 hr	38	C
Sodium lactate (1/6) M				Compatible for 8 hr	38	C

<sup>a</sup>Tested with and without potassium chloride 0.3 and 0.6% present.

#### Drugs in Syringe Compatibility

##### Mexiletine HCl

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Heparin sodium		2500 units/1 mL	BI	250 mg/10 mL	Turbidity or precipitate forms within 5 min	1053	I

Mexiletine Hydrochloride - AHFS 24:04.04.08

## Micafungin Sodium - AHFS 8:14.16

**Products** — Micafungin sodium is available in vials containing 50 and 100 mg of drug with lactose 200 mg and citric acid and/or sodium hydroxide added during manufacturing to adjust pH. Reconstitute the 50- or 100-mg vials with 5 mL of sodium chloride 0.9%, resulting in solutions containing micafungin 10 or 20 mg/mL, respectively. As an alternative, dextrose 5% may be used for reconstitution. However, diluents containing a bacteriostatic agent should not be used for reconstitution. To minimize foaming, gently swirl the vials to dissolve the contents. Do not shake vigorously. <sup>(1-1/08)</sup>

*pH* — From 5.0 to 7.0. <sup>(1-1/08)</sup>

*Trade Name(s)* — Mycamine

**Administration** — Micafungin sodium is administered by intravenous infusion in 100 mL of sodium chloride 0.9% or dextrose 5% over one hour. Existing infusion lines should be flushed with sodium chloride 0.9% prior to starting the micafungin sodium infusion. <sup>(1-1/08)</sup>

**Stability** — Store intact vials at controlled room temperature. When reconstituted as directed, the manufacturer indicates micafungin sodium is stable for up to 24 hours at room temperature. However, the drug does not contain a preservative, and the manufacturer recommends discarding partially used vials. Micafungin sodium diluted for administration is also stable for up to 24 hours at room temperature when protected from light. <sup>(1-1/08)</sup>

*Light Effects* — The manufacturer states that micafungin sodium dilutions should be protected from light but that covering tubing and drip chambers is not necessary. <sup>(1-1/08)</sup>

### Compatibility Information

## Midazolam Hydrochloride - AHFS 28:24.08

**Products** — Midazolam hydrochloride is available at a concentration equivalent to midazolam 5 mg/mL in vials containing 1, 2, 5, or 10 mL. It also is available at a concentration equivalent to midazolam 1 mg/mL in vials containing 2, 5, or 10 mL. Each milliliter also contains sodium chloride 0.8%, disodium edetate 0.01%, and benzyl alcohol 1%, with hydrochloric acid and, if necessary, sodium hydroxide to adjust the pH. Preservative-free midazolam hydrochloride 1 and 5 mg/mL is also available. <sup>(1-10/06)</sup> <sup>(4)</sup>

*pH* — The pH of the injection is 2.9 to 3.7. <sup>(1-10/06)</sup> <sup>(4)</sup> Midazolam (Roche) 0.625, 1.25, and 1.67 mg/mL in sodium chloride 0.9% had pH values of 3.6, 3.4, and 3.4, respectively. <sup>(2161)</sup>

*Osmolality* — The 5-mg/mL concentration has an osmolality of 385 mOsm/kg. <sup>(4)</sup> Midazolam (Roche) 0.625, 1.25, and 1.67 mg/mL in sodium chloride 0.9% had osmolalities of 274, 262, and 259 mOsm/kg, respectively. <sup>(2161)</sup>

*Sodium Content* — Each milliliter of the available products contains about 0.14 mEq of sodium. <sup>(4)</sup>

**Administration** — Midazolam hydrochloride is administered by intramuscular injection deep into a large muscle mass or by slow intravenous injection in incremental doses <sup>(1-10/06)</sup> <sup>(4)</sup> or intravenous infusion. <sup>(4)</sup> Use of the 1-mg/mL concentration is recommended to facilitate slower injection and dosage titration. Both concentrations may be diluted with sodium chloride 0.9% or dextrose 5%. <sup>(1-10/06)</sup> <sup>(4)</sup>

**Stability** — Midazolam hydrochloride (Roche) is a colorless to light yellow solution. It should be stored at controlled room temperature and protected from light. <sup>(1-10/06)</sup> <sup>(4)</sup>

*pH Effects* — Midazolam hydrochloride is stable at pH 3 to 3.6. <sup>(4)</sup> It is highly water soluble at pH 4 or less; at higher pH values, increased lipid solubility occurs. <sup>(1145)</sup> The rate of photodecomposition increases with increasing pH from 1.3 to 6.4. <sup>(1944)</sup>

*Light Effects* — Midazolam hydrochloride in intact containers should be stored protected from light for long-term stability of the drug. <sup>(1-10/06)</sup> <sup>(4)</sup> Exposure of the commercial injection (Roche) to sunlight for four months resulted in the yellowing of the solution in one month and a midazolam loss of about 8% in four months. <sup>(1944)</sup> However, admixtures in compatible infusion solutions do not require protection from light for short-term storage and administration. <sup>(4)</sup>

*Freezing Solutions* — The injection was physically stable when frozen for three days followed by room temperature thawing. <sup>(4)</sup>

*Syringes* — Midazolam hydrochloride (Roche) 2 mg/mL in sodium chloride 0.9% was packaged as 3 mL in 10-mL polypropylene infusion pump syringes (Pharmacia Deltec). Little or no loss occurred during 10 days of storage at 5 and 30 °C. <sup>(1967)</sup>

Midazolam hydrochloride (Roche) 3 mg/mL in sodium chloride 0.9% exhibited no visual changes and had losses of 6.5% at 20 °C and 8.7% at 32 °C in polypropylene syringes (Terumo) and of 8.9% at 32 °C in glass vials after 13 days. <sup>(1595)</sup>

The stability of midazolam (salt form unspecified) 1 mg/mL repackaged in polypropylene syringes was evaluated. Little change in concentration was found after four weeks of storage at room temperature not exposed to direct light. <sup>(2164)</sup>

Midazolam hydrochloride (Roche) 5 mg/mL was packaged as 10 mL in 12-mL polypropylene syringes

(Sherwood). No loss occurred in 36 days stored at 25 °C protected from light. [\(2088\)](#)

## Compatibility Information

### Solution Compatibility

#### Midazolam HCl

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% with potassium chloride 0.15%	BA <sup>a</sup>	RC	0.1 and 0.5 g	13% loss in 24 hr at ambient temperature. 10% calculated loss in 20 hr	<a href="#">1868</a>	I
Dextrose 5% with potassium chloride 0.15%	BA <sup>a</sup>	RC	1 g	7% loss in 24 hr at ambient temperature. 10% calculated loss in 35 hr	<a href="#">1868</a>	C
Dextrose 5% in sodium chloride 0.9%	GRI	RC	0.1 and 0.5 g	8 to 10% loss in 24 hr at ambient temperature	<a href="#">1868</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polyolefin containers.

<sup>c</sup>Tested in both glass and PVC containers.

<sup>d</sup>Tested in PVC, glass, and polyethylene-lined laminated containers.

<sup>e</sup>Also contained benzyl alcohol 1%.

<sup>f</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>g</sup>Tested in glass containers.

<sup>h</sup>Tested in polyethylene containers.

### Additive Compatibility

#### Midazolam HCl

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Aminophylline		720 mg	RC	50 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Aminophylline		720 mg	RC	250 mg	NS	Transient precipitate that dissipates	<a href="#">355</a>	?
Aminophylline		720 mg	RC	400 mg	NS	Precipitate forms immediately	<a href="#">355</a>	I
Amoxicillin sodium	BE	10 g	RC	50 and 250 mg	NS	Transient precipitate	<a href="#">355</a>	?
Amoxicillin sodium	BE	10 g	RC	400 mg	NS	Precipitate forms immediately	<a href="#">355</a>	I
Cefuroxime sodium	GL	7.5 g	RC	50, 250, 400 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Ciprofloxacin	BAY	2 g	RC	200 mg	D5W	Visually compatible. No ciprofloxacin loss in 24 hr at 22 °C in light. Midazolam not tested	<a href="#">2413</a>	C
Furosemide		80 mg	RC	50 and 250 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Gentamicin sulfate	EX	800 mg	RC	50, 250, 400 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C

Hydromorphone HCl	KN	0.5 to 45 g	RC	0.1 to 4.5 g	D5W, NS	Visually compatible for 24 hr at room temperature	<a href="#">2086</a>	C
Hydromorphone HCl	KN	2 and 20 g	RC	100 and 500 mg	D5W, NS	Visually compatible. Under 7% hydromorphone and midazolam loss in 23 days at 4 and 23 °C	<a href="#">2086</a>	C
Metronidazole		5 g	RC	50, 250, 400 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Oxycodone HCl	NAP	830 mg	RC	830 mg	NS, W	Visually compatible. Under 4% concentration change in 24 hr at 25 °C	<a href="#">2600</a>	C
Ranitidine HCl	GL	400 mg	RC	50 and 250 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Sodium bicarbonate	<a href="#">b</a>	5%	RC	100 mg		Transient precipitation upon mixing	<a href="#">355</a>	?
Sodium bicarbonate	<a href="#">b</a>	5%	RC	500 mg		Precipitation upon mixing	<a href="#">355</a>	I
Tramadol HCl	AND	11.18 g	RC	500 mg	NS <sup>a</sup>	Visually compatible for 7 days at 25 °C protected from light	<a href="#">2701</a>	C
Tramadol HCl	AND	33.3 g	RC	1.5 g	NS <sup>a</sup>	Visually compatible for 7 days at 25 °C protected from light	<a href="#">2701</a>	C

<sup>a</sup>Tested in elastomeric pump reservoirs (Baxter).

<sup>b</sup>Tested in glass containers.

### Drugs in Syringe Compatibility

#### Midazolam HCl

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Alfentanil HCl	JN	0.5 mg/mL	RC	0.2 mg/mL <sup>a</sup>	Visually compatible. 8% midazolam and 2% alfentanil loss in 3 weeks at 20 °C in light. No alfentanil loss and 7% midazolam loss in 4 weeks at 6 °C in dark	<a href="#">2133</a>	C
Atracurium besylate	BW	10 mg/mL		5 mg/mL	Physically compatible and atracurium stable for 24 hr at 5 and 30 °C	<a href="#">1694</a>	C
Atropine sulfate	IX	0.4 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Buprenorphine HCl	NE	0.3 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Butorphanol tartrate	BR	2 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Chlorpromazine HCl	SKF	50 mg/2 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Dexamethasone sodium phosphate	DB	2 mg/8 mL	RC	2.5 mg/8 mL	Diluted in NS. Visually clear. No dexamethasone loss in 48 hr. Midazolam losses over 10% beyond 24 hr at room	<a href="#">2531</a>	C

Dexamethasone sodium phosphate	DB	2 mg/8 mL	RC	5 mg/8 mL	temperature Diluted in NS. Visually clear. No dexamethasone loss in 48 hr. Midazolam losses were 7% in 48 hr at room temperature	<a href="#">2531</a>	C
Dexamethasone sodium phosphate	DB	4 mg/8 mL	RC	5 mg/8 mL	Diluted in NS. Cloudiness forms immediately	<a href="#">2531</a>	I
Dexamethasone sodium phosphate	DB	4 mg/8 mL	RC	7.5 mg/8 mL	Diluted in NS. Cloudiness forms immediately	<a href="#">2531</a>	I
Dexamethasone sodium phosphate	DB	2 mg/8 mL	RC	7.5 mg/8 mL	Diluted in NS. Crystals form in some samples within 24 hr	<a href="#">2531</a>	I
Diamorphine HCl	EV	10 mg	RC	10 <sup>b</sup> and 75 <sup>c</sup> mg	Visually compatible. 10% diamorphine and no midazolam loss in 15.9 days at 22 °C	<a href="#">1792</a>	C
Diamorphine HCl	EV	500 mg	RC	10 <sup>b</sup> and 75 <sup>c</sup> mg	Visually compatible. 10% diamorphine and no midazolam loss in 22.2 days at 22 °C	<a href="#">1792</a>	C
Dimenhydrinate	SE	50 mg/1 mL	RC	5 mg/1 mL	White precipitate forms immediately	<a href="#">1145</a>	I
Diphenhydramine HCl	ES	50 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Droperidol	JN	2.5 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Fentanyl citrate	ES	0.1 mg/2 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Fentanyl citrate	DB	12.5 mcg/mL <sup>a</sup>	RC	0.625 and 0.938 mg/mL <sup>a</sup>	Visually compatible. Little fentanyl loss. 7 and 9% midazolam loss in 7 days at 5 and 22 °C, respectively	<a href="#">2202</a>	C
Fentanyl citrate	DB	37.5 mcg/mL <sup>a</sup>	RC	0.625 mg/mL <sup>a</sup>	Visually compatible. No fentanyl loss. 5 and 8% midazolam loss in 7 days at 5 and 22 °C, respectively	<a href="#">2202</a>	C
Fentanyl citrate	DB	37.5 mcg/mL <sup>a</sup>	RC	0.938 mg/mL <sup>a</sup>	Visually compatible. Little fentanyl loss. 7 and 9% midazolam loss in 7 days at 5 and 22 °C, respectively	<a href="#">2202</a>	C
Fentanyl citrate	DB	33.3 mcg/mL <sup>a</sup>	RC	0.278 and 0.833 mg/mL <sup>a</sup>	Visually compatible. No fentanyl loss. 5 and 7% midazolam loss in 7 days at 5 and 22 °C, respectively	<a href="#">2202</a>	C
Fentanyl citrate with metoclopramide HCl	DB AST	1 mg/20 mL 20 mg/4 mL	RC	15 mg/3 mL	Visually compatible with 7% or less loss of each drug in 10 days at 32 °C	<a href="#">2268</a>	C

Glycopyrrolate	RB	0.2 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Heparin sodium		2500 units/1 mL	RC	15 mg/3 mL	Turbidity or precipitate forms within 5 min	<a href="#">1053</a>	I
Hydromorphone HCl	WB	2 mg/0.5 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Hydroxyzine HCl	ES	100 mg/2 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Meperidine HCl	WB	100 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Metoclopramide HCl	RB	10 mg/2 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Metoclopramide HCl with fentanyl citrate	AST DB	20 mg/4 mL 1 mg/20 mL	RC	15 mg/3 mL	Visually compatible with 7% or less loss of each drug in 10 days at 32 °C	<a href="#">2268</a>	C
Morphine sulfate	WB	10 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Morphine sulfate		5 and 10 mg/1 mL <sup>d</sup>	RC	5 mg/1 mL	Visually compatible. 9% or less morphine and 8% or less midazolam loss in 14 days at 22 °C in dark. Microprecipitate may form, requiring filtration	<a href="#">1901</a>	C
Morphine sulfate		5 and 10 mg/1 mL <sup>e</sup>	RC	5 mg/1 mL	Visually compatible. 8% or less morphine and 3% or less midazolam loss in 14 days at 22 °C protected from light. Microprecipitate may form, requiring filtration	<a href="#">1901</a>	C
Nalbuphine HCl	DU	10 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Ondansetron HCl	GW	1.33 mg/mL <sup>a</sup>	RC	1.66 mg/mL <sup>a</sup>	Physically compatible. Under 4% ondansetron and under 7% midazolam losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Oxycodone HCl	NAP	200 mg/20 mL	RC	100 mg/20 mL	Visually compatible. Under 4% concentration change in 24 hr at 25 °C	<a href="#">2600</a>	C
Pantoprazole sodium	<sup>f</sup>	4 mg/1 mL		5 mg/1 mL	Precipitates immediately	<a href="#">2574</a>	I
Pentobarbital sodium	WY	100 mg/2 mL	RC	5 mg/1 mL	White precipitate forms immediately	<a href="#">1145</a>	I
Prochlorperazine edisylate	SKF	10 mg/2 mL	RC	5 mg/1 mL	White precipitate forms immediately	<a href="#">1145</a>	I
Promethazine HCl	WY	25 mg/1 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Ranitidine HCl	GL	50 mg/2 mL	RC	5 mg/1 mL	White precipitate forms immediately	<a href="#">1145</a>	I

Scopolamine HBr	BW	0.43 mg/0.5 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Trimethobenzamide HCl	BE	200 mg/2 mL	RC	5 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C

<sup>a</sup>Diluted with sodium chloride 0.9%.

<sup>b</sup>Diluted with sterile water to 15 mL.

<sup>c</sup>Diamorphine hydrochloride constituted with midazolam injection.

<sup>d</sup>Morphine sulfate powder dissolved in dextrose 5%.

<sup>e</sup>Morphine sulfate powder dissolved in water and sodium chloride 0.9%.

<sup>f</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in sterile water for injection.

<sup>d</sup>Tested in Ringer's injection, lactated.

<sup>e</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>f</sup>Concentration unspecified.

<sup>g</sup>Concentration expressed in milligrams of phenytoin sodium equivalents (PE) per milliliter.

<sup>h</sup>Given over three minutes into a heparin infusion run at 1 mL/min.

<sup>i</sup>Tested in dextrose 5% in sodium chloride 0.225%.

<sup>j</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>k</sup>Amoxicillin sodium component. Amoxicillin sodium in a 10:1 fixed-ratio concentration with clavulanic acid.

<sup>l</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

## Milrinone Lactate - AHFS 24:04.08

**Products** — Milrinone lactate is available as a solution containing the equivalent of milrinone 1 mg/mL in 10-, 20-, and 50-mL single-dose vials. Each milliliter also contains dextrose, anhydrous, 47 mg in water for injection. Lactic acid or sodium hydroxide may have been used to adjust the pH. The total lactic acid concentration may vary between 0.95 and 1.29 mg/mL. The 1-mg/mL concentration must be diluted for use. <sup>(1-9/07)</sup>

Milrinone lactate is also available as a ready-to-use solution in 100- and 200-mL flexible PVC plastic containers at a concentration equivalent to milrinone 0.2 mg/mL (200 mcg/mL). The solution has a nominal lactic acid concentration of 0.282 mg/mL and also contains dextrose, anhydrous 49.4 mg/mL. <sup>(1-9/07)</sup>

*pH* — From 3.2 to 4. <sup>(1-9/07)</sup>

**Administration** — Milrinone lactate is administered intravenously. For maintenance administration by continuous intravenous infusion, milrinone lactate in vials is diluted in a compatible diluent, usually to 200 mcg/mL. The premixed 200-mcg/mL infusion in flexible plastic containers need not be diluted for use. When milrinone lactate is administered by continuous infusion, the use of a calibrated electronic infusion device is recommended. <sup>(1-9/07)</sup>

**Stability** — Milrinone lactate solutions are colorless to pale yellow. The 1-mg/mL concentration should be stored at controlled room temperature and protected from freezing. The 0.2-mg/mL concentration in PVC containers should be stored at room temperature of 25 °C and should be protected from freezing and exposure to excessive heat. Brief exposure to temperatures up to 40 °C does not adversely affect the product. <sup>(1-9/07)</sup>

### Compatibility Information

#### Solution Compatibility

##### Milrinone lactate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	<a href="#">c</a>	WI	200 mg	Physically compatible. Stable for 72 hr at room temperature in light or dark	<a href="#">1468</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>e</sup>Tested in Ringer's injection, lactated.

<sup>f</sup>Tested in dextrose 5% in sodium chloride 0.225%.

<sup>g</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

## Mitomycin - AHFS 10:00

**Products** — Mitomycin is available in 5-, 20-, and 40-mg vials with mannitol 10, 40, and 80 mg, respectively. Reconstitute the 5-mg vials with 10 mL, the 20-mg vials with 40 mL, and the 40-mg vials with 80 mL of sterile water for injection and shake to aid dissolution. Allow to stand at room temperature if dissolution does not take place immediately. The reconstituted solution contains 500 mcg/mL of mitomycin. [\(1-10/06\)](#) [\(4\)](#)

*pH* — From 6 to 8. [\(4\)](#)

**Administration** — Mitomycin is administered intravenously through a functioning intravenous catheter. Extravasation should be avoided because cellulitis, ulceration, and sloughing may occur. It has been recommended that mitomycin be administered through the tubing of a running infusion solution to avoid this problem. [\(1-10/06\)](#) [\(4\)](#)

In the event of spills or leaks, Bristol-Myers Squibb recommends the use of sodium hypochlorite 5% (household bleach) or potassium permanganate 1% to inactivate mitomycin. [\(1200\)](#)

**Stability** — Intact vials should be stored at controlled room temperature and protected from light. Temperatures exceeding 40 °C should be avoided. Reconstituted solutions are stable for two weeks stored under refrigeration or for one week at room temperature. [\(1-10/06\)](#) [\(4\)](#)

Mitomycin (Kyowa) 0.6 and 0.8 mg/mL in water for injection exhibited 10% loss in seven days at 21 °C in the dark. When stored at 4 °C in the dark, the 0.6-mg/mL concentration lost 7% in seven days. Although exhibiting no loss in 24 hours when stored at 4 °C in the dark, the 0.8-mg/mL concentration developed a fine, pink, needle-like precipitate in three days. At a higher concentration of 1 mg/mL in water for injection similar results were obtained. Refrigeration resulted in fine, pink, needle-like precipitate formation in 24 hours. The 1-mg/mL concentration stored at 21 °C exposed to fluorescent light exhibited 6% loss in 24 hours and developed the fine, pink, needle-like precipitate in four days. Stored at a higher temperature of 25 °C in the dark, losses of 6% in 24 hours and 10% in seven days were found with no precipitate forming. [\(1503\)](#)

*pH Effects* — Mitomycin is very stable in solution at a neutral pH but undergoes more rapid decomposition at acidic and basic pH. [\(1119\)](#) [\(1203\)](#) [\(1204\)](#) [\(1866\)](#) The decomposition is complex and pH dependent, producing different decomposition products in acidic and basic solutions. [\(1119\)](#) [\(1283\)](#) [\(1284\)](#) The pH of maximum stability is approximately pH 7. [\(1072\)](#) [\(1203\)](#) [\(1204\)](#) [\(1379\)](#) At pH 7, a 10% mitomycin loss occurs in seven days at room temperature. [\(1072\)](#) At a concentration of 0.05 mg/mL in dextrose 5% buffered to pH 7.8 with a mixture of phosphates, mitomycin was stable for 15 days at room temperature and over 120 days when refrigerated. [\(1118\)](#)

Both pH and storage temperature are important to mitomycin stability. Mitomycin (150 to 600 mcg/mL) stability was tested in pH 6, 7, and 8 buffer solutions. The drug was less stable at pH 6 than at pH 7 and especially pH 8. At pH 6, drug losses of around 96 and 41% occurred at room temperature and under refrigeration, respectively, over 28 days. However, mitomycin was more stable at pH 7 and 8. Drug losses when stored under refrigeration for 28 days were about 10 to 20% in this pH range. [\(2651\)](#)

*Temperature Effects* — Heating mitomycin 0.6 mg/mL in sodium chloride 0.9% to 100 °C resulted in a 24% drug loss in 30 minutes and a 58% loss in one hour. [\(1285\)](#)

*Freezing Solutions* — Mitomycin 0.6 mg/mL in sodium chloride 0.9% crystallized out of solution when frozen at -20 °C. The particles did not redissolve after thawing in a microwave oven. Freezing to -30 °C, below the eutectic temperature, resulted in no loss of mitomycin during four weeks of storage, microwave thawing, and refreezing at -30 °C for another four weeks. [\(1285\)](#)

*Light Effects* — The stability of mitomycin is not adversely affected by the presence or absence of normal fluorescent light. <sup>(1503)</sup>

*Syringes* — Mitomycin (Bristol-Myers Squibb) reconstituted to a concentration of 0.5 mg/mL with sterile water was repackaged in 1-mL polypropylene tuberculin syringes (Sherwood). Syringes were stored at both 5 and 25 °C protected from light. About 7% mitomycin loss occurred in 11 days at 25 °C and about 8% loss in 42 days at 5 °C. <sup>(2179)</sup>

*Filtration* — Mitomycin 10 to 75 mcg/mL exhibited little or no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters. <sup>(1415) (1416)</sup>

Mitomycin - AHFS 10:00

## Mitoxantrone Hydrochloride - AHFS 10:00

**Products** — Mitoxantrone hydrochloride is supplied as a concentrate for further dilution in 10-mL multidose vials. Each milliliter of the dark blue aqueous solution contains mitoxantrone 2 mg (as the hydrochloride salt), sodium chloride 0.8%, sodium acetate 0.005%, and acetic acid 0.046%.<sup>(1-5/07)</sup>

*pH* — From 3 to 4.5.<sup>(1-5/07)</sup>

*Sodium Content* — Each milliliter contains sodium 0.14 mEq.<sup>(1-5/07)</sup>

*Trade Name(s)* — Novantrone

**Administration** — Mitoxantrone hydrochloride must be diluted for use. The drug is administered by slow intravenous infusion after dilution to at least 50 mL in dextrose 5% or sodium chloride 0.9%. Mitoxantrone hydrochloride is usually administered over 15 to 30 minutes through the tubing of a freely running intravenous solution<sup>(1-5/07)</sup> (4) or by continuous intravenous infusion over 24 hours.<sup>(4)</sup> It should not be given over less than three minutes.<sup>(1-5/07)</sup> (4)

**Stability** — Intact vials of the dark blue concentrate should be stored at controlled room temperature and protected from freezing.<sup>(1-5/07)</sup> Refrigeration of the concentrate may cause a precipitate, which redissolves upon warming to room temperature.<sup>(72)</sup> (1369)

The manufacturer indicates that mitoxantrone hydrochloride concentrate remaining in partially used vials may be stored for up to seven days at 15 to 25 °C and up to 14 days under refrigeration but should not be stored frozen.<sup>(4)</sup>

Combining heparin with mitoxantrone hydrochloride may result in precipitate formation.<sup>(1293)</sup>

*pH Effects* — The pH range of maximum stability is 2 to 4.5 but was unstable when the pH was increased to 7.4.<sup>(1379)</sup>

*Light Effects* — Mitoxantrone hydrochloride is not photolabile. Exposure of the product to direct sunlight for one month caused no change in its appearance or concentration.<sup>(72)</sup> (1293)

*Syringes* — Mitoxantrone hydrochloride 0.2 mg/mL in sodium chloride 0.9% in polypropylene syringes (Braun Omnifix) is reported to be stable for 28 days at 4 and 20 °C<sup>(1564)</sup> and for 24 hours at 37 °C.<sup>(1369)</sup>

Mitoxantrone hydrochloride (Lederle) 2 mg/mL in glass vials and drawn into 12-mL plastic syringes (Monoject) exhibited no visual changes and little or no loss when stored for 42 days at 4 and 23 °C. Potential extractable materials from the syringes were not detectable during the study period.<sup>(1593)</sup>

*Sorption* — Mitoxantrone hydrochloride (Lederle) 1 mg/mL in sodium chloride 0.9% exhibited no loss due to sorption to PVC and polyethylene administration lines during simulated infusion at 0.875 mL/hr for 2.5 hours via a syringe pump.<sup>(1795)</sup>

*Filtration* — Although binding of mitoxantrone hydrochloride to filters has been reported<sup>(1249)</sup> (1415) (1416), the manufacturer states that filtration of mitoxantrone hydrochloride through a 0.22- $\mu$ m filter (Millipore) results in no loss.<sup>(1293)</sup>

Mitoxantrone hydrochloride (Lederle) 1 mg/mL in sodium chloride 0.9%, during simulated infusion at 0.875 mL/hr for 2.5 hours via a syringe pump, exhibited no loss due to sorption to cellulose acetate (Minisart 45, Sartorius), polysulfone (Acrodisc 45, Gelman), and nylon (Posidyne ELD96, Pall) filters.<sup>(1795)</sup>

Mitoxantrone Hydrochloride - AHFS 10:00

## Morphine Sulfate - AHFS 28:08.08

**Products** — Morphine sulfate is available in a variety of concentrations and sizes ranging from 0.5 to 50 mg/mL. The Astramorph PF and Duramorph 0.5- and 1-mg/mL concentrations and the Infumorph 200- (10 mg/mL) and Infumorph 500- (25 mg/mL) formulations are preservative free. Morphine hydrochloride and morphine tartrate injections are also available in some countries. Other morphine products may contain various preservatives, antioxidants, and buffers, including chlorobutanol, phenol, sodium bisulfite, sodium phosphates, and sodium formaldehyde sulfoxylate. (4) (38)

*pH* — From 2.5 to 6.5 for most products. Duramorph has a pH of 3.5 to 7, and Infumorph has a pH of about 4.5. (4) (17) Morphine sulfate 7.5 mg/mL in sodium chloride 0.9% had a pH of 3.5. (2161)

*Osmolality* — Morphine sulfate 7.5 mg/mL in sodium chloride 0.9% had an osmolality of 236 mOsm/kg. (2161)

*Trade Name(s)* — Astramorph PF, Duramorph, Infumorph

**Administration** — Morphine sulfate is usually administered subcutaneously but may be administered by intramuscular or slow intravenous injection and by slow continuous subcutaneous or intravenous infusion. For continuous intravenous infusion, a concentration of 0.1 to 1 mg/mL in dextrose 5% may be infused using an infusion control device; more concentrated solutions also have been used. Duramorph, Infumorph, and Astramorph PF contain no preservatives and may be administered intrathecally or epidurally. (1-8/05) (4)

High-concentration morphine sulfate is not recommended for subcutaneous, intramuscular, or intravenous injection of individual doses or for intrathecal or epidural administration. The products are intended for continuous intravenous infusion using a suitable microinfusion control device. (4)

**Stability** — Morphine sulfate injections are clear, colorless solutions. Intact containers should be stored at controlled room temperature and protected from freezing and light. The manufacturers state that the products should not be heat sterilized. (1-8/05) Morphine sulfate darkens upon prolonged exposure to light. (4)

Undiluted morphine sulfate 10 mg/mL, stored in 100-mL glass vials and PVC bags, exhibited no loss in 30 days at 23 °C. (1394)

Morphine sulfate (Wyeth) 1 mg/mL in bacteriostatic sodium chloride 0.9% containing benzyl alcohol 0.9%, when stored in glass vials with protection from light, exhibited no loss at 4 °C and a 4% loss at 22 °C after 91 days. (1583)

Morphine sulfate 15 and 2 mg/mL diluted with sterile water for injection at 4 and 24 °C in 200-mL PVC bags (Baxter) was stable at both temperatures with little loss in 15 days. (1504)

Morphine sulfate under simulated summer conditions in paramedic vehicles was exposed to 26 to 38 °C over four weeks. No drug loss occurred under these conditions. (2562)

Morphine sulfate 1 mg/mL compounded in sodium chloride 0.9% was packaged in 100-mL polypropylene infusion bags and was autoclaved at 121 °C for 20 minutes for sterilization. No visible precipitation appeared and microparticulate levels remained acceptable in all samples when stored at 25 °C for three years and at 30 and 40 °C for six months. No evidence of evaporation was found in the samples, and no loss of morphine sulfate occurred in any of the solutions throughout the study. While PVC bags cannot be autoclaved and exhibit excessive loss of water through evaporation upon storage, polypropylene bags can be successfully used for compounding bags of morphine sulfate solutions with three-year stability for use in patient-controlled analgesia. (2665)

*pH Effects* — Morphine sulfate is relatively stable at acidic pH, especially below pH 4, but degradation increases greatly at neutral or basic pH. Degradation is often accompanied by a yellow to brown discoloration in the normally colorless solution. <sup>(1072)</sup> <sup>(2170)</sup>

Morphine sulfate stability at a low concentration of 2 mg/mL in an admixture with ketamine hydrochloride in sodium chloride 0.9% with the pH adjusted over a range of pH 5.5 to 7.5 was stored at room temperature over 4 days. No difference in physical or chemical drug stability was observed among the samples. <sup>(2786)</sup>

However, at higher concentrations of morphine at pH values of 6.4 and above, precipitation may occur. Morphine sulfate at about 18 mg/mL mixed with ketamine hydrochloride exhibited a pH near 4.85. Adjusting the pH higher with sodium bicarbonate injection up to pH 5.9 resulted in mixtures that were clear over 24 hours at 21 °C. However, adjusting to pH 6.2 resulted in precipitation within 2 hours. Adjusting to pH 6.4 and above resulted in immediate precipitation. <sup>(2787)</sup>

*Freezing Solutions* — Morphine sulfate (Lilly) 1 and 2 mg/mL in dextrose 5% and sodium chloride 0.9% in PVC bags exhibited no loss during 14 weeks of frozen storage at -20 °C. <sup>(1286)</sup>

*Syringes* — Prefilled into plastic syringes with syringe caps (Braun), morphine sulfate is stated to remain within acceptable limits of degradation for at least 69 days at room temperature. <sup>(982)</sup>

In another study, less than a 3% loss of morphine sulfate occurred in 12 weeks when stored in plastic syringes at 22 °C and exposed to light. A smaller loss occurred when the morphine sulfate was stored at 3 °C with light protection. <sup>(1287)</sup>

Morphine sulfate (Lilly) 1 and 5 mg/mL in dextrose 5% and sodium chloride 0.9% was packaged in 30-mL Plastipak (Becton Dickinson) syringes capped with Monoject (Sherwood) tip caps. Syringes were stored at 23 °C in light and dark, 4 °C protected from light, and frozen at -20 °C protected from light for 12 weeks. Both concentrations at all three temperatures were stable for at least six weeks when protected from light. However, the samples at 23 °C exposed to light were stable for a week, but developed unacceptable losses after that. <sup>(1894)</sup>

Morphine sulfate 2 mg/mL in sodium chloride 0.9% was packaged in 50-mL (Becton Dickinson) and 30-mL (Becton Dickinson and Sherwood) polypropylene syringes for use in patient-controlled analgesia and in stoppered glass vials. The samples were stored at room temperature in the dark for six weeks. Little loss of morphine sulfate occurred in the 50-mL syringes and the glass vials in six weeks. About 5% loss occurred when packaged in both brands of 30-mL syringes. Addition of sodium metabisulfite 0.1% as an antioxidant increased the rate of drug loss up to 10% in two weeks. <sup>(2040)</sup>

Morphine sulfate 5 mg/mL in sodium chloride 0.9% and 50 mg/mL in sterile water for injection and also in sodium chloride 0.9% packaged as 20 mL in 30-mL polypropylene syringes were stored for 60 days at 4 °C protected from light and 23 °C exposed to normal fluorescent light. Other solutions were stored frozen at -20 °C and at elevated temperature of 37 °C for two days to simulate more extreme conditions during express shipping. Little or no morphine sulfate loss occurred in the 50-mg/mL samples stored for 60 days at 4 and 23 °C even though slight yellow discoloration appeared after 30 days. The 5-mg/mL samples stored at 4 and 23 °C exhibited about 4 to 5% loss in 60 days. The frozen and 37 °C samples exhibited little or no change in morphine sulfate concentration in two days. However, samples of the 50-mg/mL concentration stored at -20 and 4 °C and samples of the 5-mg/mL concentration stored frozen at -20 °C precipitated upon low temperature storage. Although the precipitate redissolved upon warming at 37 °C for several hours, large amounts of microparticulates in the tens of thousands per milliliter remained, possibly shed by the syringe components. <sup>(2376)</sup>

*Elastomeric Reservoir Pumps* — Morphine sulfate 15 and 2 mg/mL was diluted with sterile water for injection at 4 and 24 °C in Intermate 200 (Infusion Systems) and Infusor (Baxter) disposable elastomeric infusion devices. In the Intermate 200 with 100 mL of morphine sulfate solution, little or

no loss occurred in 15 days at either 4 or 24 °C and even at 31 °C (simulating use next to a patient's skin or clothing). In the Infusor, with 50 mL, losses of 5% or more were observed in 12 days in some containers. <sup>(1504)</sup>

Morphine sulfate 0.5 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for two weeks at 35 °C with gentle agitation. <sup>(2014)</sup>

Morphine sulfate 2 and 10 mg/mL is reported to be physically and chemically stable in Accufuser Plus silicone balloon infusers when stored at room temperature and refrigerated. Little or no loss of morphine sulfate occurred in 40 days. <sup>(2678)</sup>

*Implantable Pumps* — Morphine sulfate 10 mg/mL was filled into a VIP 30 implantable infusion pump (Fresenius) and associated capillary tubing and stored at 37 °C. No morphine loss and no contamination from components of pump materials occurred during eight weeks of storage. <sup>(1903)</sup>

Morphine sulfate (Infumorph) 20 mg/mL with clonidine hydrochloride (Boehringer Ingelheim) 50 mcg/mL and morphine sulfate 2 mg/mL with clonidine hydrochloride 1.84 mg/mL were evaluated in SynchroMed EL (Medtronic) implantable pumps with silicone elastomer intrathecal catheters at 37 °C for three months. No visible incompatibilities were observed; delivered concentrations of both drugs were in the range of 94.0 to 99.6% throughout the study. Furthermore, no impairment of mechanical performance of the pump or any of its components was found. <sup>(2477)</sup>

An admixture of bupivacaine hydrochloride 25 mg/mL, clonidine hydrochloride 2 mg/mL, and morphine sulfate 50 mg/mL in sterile water for injection was reported to be physically and chemically stable for 90 days at 37 °C in SynchroMed implantable pumps. Little or no loss of any of the drugs was found. <sup>(2585)</sup>

Clonidine hydrochloride and morphine sulfate powders were dissolved in ziconotide acetate (Elan) injection to yield concentrations of 2 and 35 mg/mL and 25 mcg/mL, respectively. Stored at 37 °C, 11% ziconotide loss in 7 days, 4% clonidine loss in 20 days, and no morphine loss in 28 days occurred. <sup>(2752)</sup>

*Other Devices* — The stability of two intrathecal solutions of morphine sulfate 10 mg/mL in sodium chloride 0.9% (isobaric) and 5 mg/mL in dextrose 7% in water (hyperbaric) was evaluated. The solutions were stored at 4 and 37 °C in glass ampuls and pump reservoirs composed of silicone rubber reinforced with polyester (Cordis Europa). No precipitation or discoloration and no loss of morphine sulfate or increase in degradation products occurred in the solutions in glass ampuls after two months at either temperature. However, in the pump reservoirs, the isobaric solution in sodium chloride 0.9% developed a yellow color. Furthermore, a decomposition product, pseudomorphine, was detectable in three days and increased to 1% in one month at 37 °C. This level was 20 times that of the pseudomorphine found in the hyperbaric dextrose 7% in water solution under the same conditions. The decomposition was attributed to dissolved oxygen, ethylene oxide sterilant, and silicone rubber. <sup>(1508)</sup>

*Central Venous Catheter* — Morphine sulfate (Astra) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

Baclofen	CI	1.5 g	DB	7.5 g	NS <sup>d</sup>	Physically compatible. Little loss of either drug in 30 days at 37 °C	<a href="#">2170</a>	C
Baclofen	CI	1 g	DB	15 g	NS <sup>d</sup>	Physically compatible. Little loss of either drug in 30 days at 37 °C	<a href="#">2170</a>	C
Baclofen	CI	200 mg	DB	21 g	NS <sup>d</sup>	Physically compatible. 7% baclofen loss and little morphine loss in 30 days at 37 °C	<a href="#">2170</a>	C

Bupivacaine HCl	AST	3 g		1 g	b	Little loss of either drug in 30 days at 18 °C	<a href="#">1932</a>	C
Bupivacaine HCl	AB	625 mg and 1.25 g	SCN	100 mg	NS <sup>b</sup>	Visually compatible. No loss of either drug in 72 hr at 24 °C in light	<a href="#">2058</a>	C
Bupivacaine HCl	AB	625 mg and 1.25 g	SCN	500 mg	NS <sup>b</sup>	Visually compatible. No loss of either drug in 72 hr at 24 °C in light	<a href="#">2058</a>	C
Dobutamine HCl	LI	1 g	ES	5 g	D5W, NS	Physically compatible for 24 hr at 21 °C	<a href="#">812</a>	C
Floxacillin sodium	BE	20 g	EV	1 g	W	Haze forms in 24 hr and precipitate forms in 48 hr at 30 °C. No change at 15 °C	<a href="#">1479</a>	I
Fluconazole	PF	1 g	ES	0.25 g	D5W <sup>b</sup>	Fluconazole stable for 24 hr at 25 °C in fluorescent light. Morphine not tested	<a href="#">1676</a>	C
Fluorouracil	AB	1 and 16 g	AST	1 g	D5W, NS <sup>b</sup>	Subvisible morphine precipitate forms immediately, becoming grossly visible within 24 hr. Morphine losses of 60 to 80% occur within 1 day	<a href="#">1977</a>	I
Furosemide	HO	1 g	EV	1 g	W	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Ketamine HCl	PD	1 g	SX	1 g	NS <sup>b</sup>	At least 90% of both drugs retained for 6 days at room temperature	<a href="#">2260</a>	C
Ketamine HCl	PD	25 g	SX	25 g	NS <sup>b</sup>	At least 90% of both drugs retained for 6 days at room temperature	<a href="#">2260</a>	C
Ketamine HCl	PD	25 g	SX	25 g	NS <sup>e</sup>	At least 90% of both drugs retained for 6 days at room temperature	<a href="#">2260</a>	C
Ketamine HCl	PD	1.33 g	AB	2 g	NS	Little loss of either drug in 4 days at room temperature	<a href="#">2786</a>	C
Meropenem	ZEN	1 and 20 g	ES	1 g	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C
Metoclopramide HCl	SKB	500 mg	EV	1 g	NS <sup>b</sup>	Visually compatible. Little loss of either drug in 35 days at 22 °C and 182 days at 4 °C followed by 7 days at 32 °C	<a href="#">1939</a>	C
Metoclopramide HCl	SKB	500 mg	EV	1 g	D5W <sup>c</sup>	Visually compatible. 8% metoclopramide loss in 14 days at 22 °C and 98 days at 4 °C. No morphine loss	<a href="#">1939</a>	C
Ondansetron HCl	GL	100 mg and 1 g	AST	1 g	NS <sup>b</sup>	Physically compatible. No ondansetron loss and 5% or less morphine loss in 7 days at 32 °C or 31 days at 4 and 22 °C protected from light	<a href="#">1690</a>	C
Ropivacaine HCl	ASZ	1 g	AST	20 mg	NS <sup>f</sup>	Physically compatible. Little loss of either drug in 30 days at 30 °C in the dark	<a href="#">2433</a>	C
Ropivacaine HCl	ASZ	2 g	AST	20 and 100 mg	f	Physically compatible. Little loss of either drug in 30 days at 30 °C in the dark	<a href="#">2433</a>	C

Succinylcholine chloride	AB	2 g		16.2 mg		Physically compatible	<a href="#">3</a>	C
Verapamil HCl	KN	80 mg	KN	30 mg	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C
Ziconotide acetate	ELN	25 mg <sup>a</sup>	BB	35 g <sup>g</sup>		90% ziconotide retained for 8 days at 37 °C. No morphine loss in 17 days	<a href="#">2702</a>	C
Ziconotide acetate	ELN	25 mg <sup>a</sup>	BB	20 g <sup>g</sup>		90% ziconotide retained for 19 days at 37 °C. No morphine loss in 28 days	<a href="#">2713</a>	C
Ziconotide acetate	ELN	25 mg <sup>a</sup>	BB	10 g <sup>g</sup>		10% ziconotide loss in 34 days. No morphine loss in 60 days at 37 °C	<a href="#">2780</a>	C
Ziconotide acetate	ELN	25 mg <sup>a</sup>	BB	20 g <sup>g</sup>		10% ziconotide loss in 19 days. No morphine loss in 28 days at 37 °C	<a href="#">2780</a>	C

<sup>a</sup>Tested in SynchroMed II implantable pumps.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Tested in PCA Infusors (Baxter).

<sup>d</sup>Tested in glass containers.

<sup>e</sup>Tested in Deltec plastic medication cassette reservoirs.

<sup>f</sup>Tested in polypropylene bags (Mark II Polybags).

<sup>g</sup>Morphine sulfate powder dissolved in ziconotide acetate injection.

### Drugs in Syringe Compatibility

#### Morphine sulfate

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Alfentanil HCl	ASZ	55 mcg/mL <sup>e</sup>	DB	0.8 mg/mL <sup>e</sup>	No loss of either drug in 182 days at room temperature or refrigerated	<a href="#">2527</a>	C
Atropine sulfate		0.6 mg/1.5 mL	WY	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">14</a>	C
Atropine sulfate	ST	0.4 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a>	C
Bupivacaine HCl	AST	3 mg/mL		1 mg/mL	Little loss of either drug in 30 days at 18 °C	<a href="#">1932</a>	C
Bupivacaine HCl	<sup>g</sup>	2.5 mg/mL <sup>e</sup>	<sup>g</sup>	5 mg/mL <sup>e</sup>	Physically compatible. Little morphine or bupivacaine loss in 60 days at 23 °C in fluorescent light and at 4 °C	<a href="#">2378</a>	C
Bupivacaine HCl	<sup>g</sup>	25 mg/mL <sup>c</sup>	<sup>g</sup>	50 mg/mL <sup>a</sup>	Physically compatible. Little morphine or bupivacaine loss in 60	<a href="#">2378</a>	C

					days at 23 °C in fluorescent light and at 4 °C in dark. Slight yellow discoloration at 23 °C not indicative of decomposition	
Bupivacaine HCl with clonidine HCl	SW BI	1.5 mg/mL 0.03 mg/mL	ES	0.2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a> C
Butorphanol tartrate	BR	4 mg/2 mL	AH	15 mg/1 mL	Physically compatible for 30 min at room temperature	<a href="#">566</a> C
Caffeine citrate		20 mg/1 mL	SW	4 mg/1 mL	Visually compatible for 4 hr at 25 °C	<a href="#">2440</a> C
Chlorpromazine HCl	SKF	50 mg/2 mL	WY	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">14</a> C
Chlorpromazine HCl	PO	50 mg/2 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a> C
Clonidine HCl	FUJ	100 mcg/1 mL	SAN	10 mg/1 mL	Physically and chemically stable for 14 days at room temperature	<a href="#">2069</a> C
Clonidine HCl	<a href="#">g</a>	0.25 mg/mL <sup>e</sup>	<a href="#">g</a>	5 mg/mL <sup>e</sup>	Physically compatible. Little morphine or clonidine loss in 60 days at 23 °C in light and at 4 °C in dark	<a href="#">2380</a> C
Clonidine HCl	<a href="#">g</a>	4 mg/mL <sup>c</sup>	<a href="#">g</a>	50 mg/mL <sup>a</sup>	Physically compatible. Little morphine or clonidine loss in 60 days at 23 °C in light and at 4 °C in dark. Slight yellow discoloration at 23 °C not indicative of decomposition	<a href="#">2380</a> C
Clonidine HCl with bupivacaine HCl	BI SW	0.03 mg/mL 1.5 mg/mL	ES	0.2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a> C
Dimenhydrinate	HR	50 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a> C
Diphenhydramine HCl	PD	50 mg/1 mL	WY	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">14</a> C
Diphenhydramine HCl	PD	50 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a> C
Droperidol	MN	2.5 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a> C
Fentanyl citrate	MN	0.05 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a> C
Glycopyrrolate	RB	0.2 mg/1 mL	LI	15 mg/1 mL	Physically compatible. pH in glycopyrrolate stability range for 48 hr at 25 °C	<a href="#">331</a> C
Glycopyrrolate	RB	0.2 mg/1 mL	LI	30 mg/2 mL	Physically compatible. pH in glycopyrrolate stability range for 48 hr at 25 °C	<a href="#">331</a> C

Glycopyrrolate	RB	0.4 mg/2 mL	LI	15 mg/1 mL	Physically compatible. pH in glycopyrrolate stability range for 48 hr at 25 °C	<a href="#">331</a>	C
Haloperidol lactate	MN	5 mg/1 mL		5 and 10 mg/1 mL <sup>c</sup>	Cloudiness forms immediately, becoming a crystalline precipitate of haloperidol and parabens	<a href="#">1901</a>	I
Haloperidol lactate	MN	2 mg/mL	ME	20 mg/mL <sup>a</sup>	White precipitate of haloperidol forms on mixing	<a href="#">668</a>	I
Heparin sodium	WY	100 and 200 units		1, 2, 5, 10 mg	Brought to 5 mL with NS. Physically compatible with no morphine loss in 24 hr at 23 °C	<a href="#">985</a>	C
Heparin sodium	WY	100 and 200 units		1, 2, 5 mg	Brought to 5 mL with W. Physically compatible with no morphine loss in 24 hr at 23 °C	<a href="#">985</a>	C
Heparin sodium	WY	100 and 200 units		10 mg	Brought to 5 mL with W. Immediate haze with precipitate and 5 to 7% morphine loss	<a href="#">985</a>	I
Hydroxyzine HCl	PF	100 mg/4 mL	WY	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">14</a>	C
Hydroxyzine HCl	PF	50 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a>	C
Hydroxyzine HCl	PF	50 mg/1 mL		10 mg/0.7 mL	Physically compatible	<a href="#">771</a>	C
Hydroxyzine HCl	PF	100 mg/2 mL		5 mg/0.3 mL	Physically compatible	<a href="#">771</a>	C
Ketamine HCl	PD	1 mg/mL <sup>e</sup>	SX	1 mg/mL <sup>e</sup> , 10 mg/mL <sup>e</sup>	At least 90% of both drugs retained for 6 days at room temperature	<a href="#">2260</a>	C
Ketamine HCl	PD	1 mg/mL <sup>e</sup>	SX	25 mg/mL <sup>e</sup>	5% morphine loss in 6 days at room temperature. Up to 15% ketamine loss in 2 to 6 days	<a href="#">2260</a>	C
Ketamine HCl	PD	10, 25 mg/mL <sup>e</sup>	SX	1, 10, 25 mg/mL <sup>e</sup>	At least 90% of both drugs retained for 6 days at room temperature	<a href="#">2260</a>	C
Ketamine HCl		5, 10, 20 mg/1 mL		1 mg/1 mL	No substantial change in the concentration of either drug over 4 days	<a href="#">669</a>	C
Ketamine HCl	SZ	2 mg/mL <sup>e</sup>	SZ	2, 5, 10 mg/mL <sup>e</sup>	Physically compatible. Little loss of either drug at 23 and 5 °C in 91 days	<a href="#">2797</a>	C
Ketamine HCl with lidocaine HCl	PD AST	2 mg/mL 2 mg/mL	ES	0.2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C
Lidocaine HCl with ketamine HCl	AST PD	2 mg/mL 2 mg/mL	ES	0.2 mg/mL	Diluted to 5 mL with NS. Visually compatible with no new GC/MS peaks in 1 hr at room temperature	<a href="#">1956</a>	C
Meperidine HCl	WI	50 mg/1 mL	ST	15 mg/1 mL	Physically incompatible within 15 min	<a href="#">326</a>	I

Metoclopramide HCl	NO	10 mg/2 mL	AH	10 mg/1 mL	Physically compatible for 15 min at room temperature	<a href="#">565</a>	C
Metoclopramide HCl	SKB	0.5 mg/mL	EV	1 mg/mL	Diluted with NS. 5% or less loss of both drugs in 35 days at 22 °C and 182 days at 4 °C followed by 7 days at 32 °C	<a href="#">1939</a>	C
Metoclopramide HCl	RB	5 mg/mL	ME	25 mg/mL <sup>a</sup>	Visually compatible with less than 10% drug loss in 7 days at 8 °C	<a href="#">668</a>	C
Midazolam HCl	RC	5 mg/1 mL	WB	10 mg/1 mL	Physically compatible for 4 hr at 25 °C	<a href="#">1145</a>	C
Midazolam HCl	RC	5 mg/1 mL		5 and 10 mg/1 mL <sup>c</sup>	Visually compatible. 9% or less morphine and 8% or less midazolam loss in 14 days at 22 °C in dark. Microprecipitate may form, requiring filtration	<a href="#">1901</a>	C
Midazolam HCl	RC	5 mg/1 mL		5 and 10 mg/1 mL <sup>d</sup>	Visually compatible. 8% or less morphine and 3% or less midazolam loss in 14 days at 22 °C protected from light. Microprecipitate may form, requiring filtration	<a href="#">1901</a>	C
Milrinone lactate	STR	5.25 mg/5.25 mL	WI	40 mg/5 mL	Physically compatible. No loss of either drug in 20 min at 23 °C	<a href="#">1410</a>	C
Ondansetron HCl	GW	1.33 mg/mL <sup>e</sup>	ES	2.67 mg/mL <sup>e</sup>	Physically compatible. Under 5% ondansetron and under 4% morphine losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Pantoprazole sodium	<a href="#">b</a>	4 mg/1 mL		50 mg/1 mL	Yellowish precipitate	<a href="#">2574</a>	I
Pentazocine lactate	WI	30 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a>	C
Pentobarbital sodium	AB	500 mg/10 mL		16.2 mg/1 mL	Physically compatible	<a href="#">55</a>	C
Pentobarbital sodium	WY	100 mg/2 mL	WY	15 mg/1 mL	Precipitate forms within 15 min	<a href="#">14</a>	I
Pentobarbital sodium	AB	50 mg/1 mL	ST	15 mg/1 mL	Physically incompatible within 15 min	<a href="#">326</a>	I
Prochlorperazine edisylate	SKF		WY	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">14</a>	C
Prochlorperazine edisylate	PO	5 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a>	C
Prochlorperazine edisylate	ES, SKF	10 mg/2 mL	WB	10 mg/1 mL	Precipitates immediately, probably due to phenol in morphine formulation	<a href="#">1006</a>	I
Prochlorperazine edisylate	SKF	5 mg/1 mL	WY	8, 10, 15 mg/1 mL	Physically compatible for 24 hr at 25 °C	<a href="#">1086</a>	C
Promethazine HCl	WY	50 mg/2 mL	WY	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">14</a>	C

Promethazine HCl	PO	50 mg/2 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a>	C
Promethazine HCl	WY	12.5 mg	WY	8 mg	Cloudiness develops	<a href="#">98</a>	I
Ranitidine HCl	GL	50 mg/2 mL	AH	10 mg/1 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Salbutamol	GL	2.5 mg/2.5 mL <sup>f</sup>	AB	5 mg/0.5 mL	Physically compatible for 1 hr	<a href="#">1904</a>	C
Scopolamine HBr		0.6 mg/1.5 mL	WY	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">14</a>	C
Scopolamine HBr	ST	0.4 mg/1 mL	ST	15 mg/1 mL	Physically compatible for at least 15 min	<a href="#">326</a>	C
Scopolamine HBr	BP	5 mg/5 mL	BP	500 mg/5 mL	Little scopolamine loss in 14 days at room temperature or 37 °C. Morphine not tested	<a href="#">1609</a>	C
Ziconotide acetate	ELN	25 mcg/mL	BB	35 mg/mL <sup>h</sup>	No loss of either drug in 17 days at 5 °C	<a href="#">2702</a>	C

<sup>a</sup>Tested in sterile water for injection.

<sup>b</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>c</sup>Morphine sulfate powder dissolved in dextrose 5%.

<sup>d</sup>Morphine sulfate powder dissolved in water and sodium chloride 0.9%.

<sup>e</sup>Diluted in sodium chloride 0.9%.

<sup>f</sup>Both preserved (benzyl alcohol 0.9%; benzalkonium chloride 0.01%) and unpreserved sodium chloride 0.9% were used as a diluent.

<sup>g</sup>Extemporaneously compounded from bulk drug powders.

<sup>h</sup>Morphine sulfate powder dissolved in ziconotide acetate injection.

### **Additional Compatibility Information**

*Bupivacaine* — Bupivacaine hydrochloride 25 mg/mL admixed with morphine sulfate 50 mg/mL in sterile water for injection appeared to prevent the formation of precipitation that occurs with morphine sulfate 50 mg/mL alone when refrigerated. <sup>(2378)</sup>

Bupivacaine hydrochloride 2.5 mg/mL admixed with morphine sulfate 5 mg/mL in sodium chloride 0.9% and bupivacaine hydrochloride 25 mg/mL admixed with morphine sulfate 50 mg/mL in sterile water for injection exhibited little or no loss of either drug in 60 days at 4 and 23 °C. The slight yellow discoloration that appeared in the high concentration samples was not indicative of drug decomposition. Samples stored for two days at 37 °C and frozen for two days at -20 °C resulted in little or no loss of either drug. However, the frozen samples upon thawing exhibited the formation of large amounts of microparticulates numbering in the thousands per milliliter, possibly shed by the syringe components. <sup>(2378)</sup>

*Clonidine Hydrochloride* — Clonidine hydrochloride (Fujisawa) 100 mcg/mL and morphine sulfate (Elkins-Sinn) 10 mg/mL were mixed in equal quantities, transferred to flint glass vials with rubber stoppers, and stored for 14 days at controlled room temperature protected from light. The solutions remained clear and colorless with no increase in particulate content. Little or no change in concentration for either drug occurred. <sup>(2069)</sup>

Clonidine hydrochloride 0.25 mg/mL admixed with morphine sulfate 5 mg/mL in sodium chloride 0.9% and clonidine hydrochloride 4 mg/mL admixed with morphine sulfate 50 mg/mL in sterile water for injection exhibited little or no loss of either drug at 4 and 23 °C. The slight yellow discoloration that appeared in the high concentration samples was not indicative of drug decomposition. Samples stored for two days at 37 °C and frozen for two days at -20 °C resulted in little or no loss of either drug. However, a precipitate formed in the frozen samples as freezing occurred and in the refrigerated high concentration samples after two to four days. Upon warming to room temperature the precipitate redissolved, but the samples exhibited large amounts of undissolved microparticulates numbering in the thousands per milliliter remaining in the solutions, possibly shed by the syringe components. <sup>(2380)</sup>

## Moxifloxacin Hydrochloride - AHFS 8:12.18

**Products** — Moxifloxacin hydrochloride is available as a ready-to-use 1.6 mg/mL clear yellow injection in 250-mL (400-mg) plastic bags with sodium chloride 0.8% in water for injection. Hydrochloric acid and/or sodium hydroxide may have been added during manufacturing to adjust pH. [\(1-1/09\)](#)

*pH* — From 4.1 to 4.6. [\(1-1/09\)](#)

*Trade Name(s)* — Avelox

**Administration** — Moxifloxacin hydrochloride is administered by intravenous infusion only over 60 minutes once every 24 hours. No dilution of the injection is necessary. [\(1-1/09\)](#)

**Stability** — Moxifloxacin hydrochloride is stored at controlled room temperature. The manufacturer notes that high humidity should be avoided. The product should not be refrigerated because precipitation may result. Any unused portions should be discarded. [\(1-1/09\)](#)

Moxifloxacin hydrochloride 25 mg/mL in two peritoneal dialysis solutions was evaluated for stability. No color change or precipitation occurred. In Dianeal PD1 1.36% and 3.86% moxifloxacin hydrochloride lost 2% and 9%, respectively, in 14 days at 4 °C, and 3% and 11%, respectively, in 7 days at 25 °C. Losses at 37 °C were higher. In Dianeal PD1 1.36%, 10% loss occurred in 3 days; in Dianeal PD1 3.86%, 7% loss occurred in 12 hours and 13% loss occurred in 24 hours. [\(2712\)](#)

Moxifloxacin Hydrochloride - AHFS 8:12.18

## Multivitamins - AHFS 88:28

**Products** — Multivitamin products for parenteral administration are available in a variety of compositions and sizes. The following products are representative formulations.

M.V.I. Adult is available as a package of two vials (labeled Vial 1 and Vial 2) that are prepared for use by transferring the contents of Vial 1 into Vial 2 and mixing gently. After mixing, the product contains<sup>(1-5/07)</sup> :

Ascorbic acid	200 mg
Vitamin A	1 mg
Vitamin D <sub>3</sub> (ergocalciferol)	5 mcg
Thiamine (as hydrochloride)	6 mg
Riboflavin (as 5'-phosphate sodium)	3.6 mg
Pyridoxine hydrochloride	6 mg
Niacinamide	40 mg
Dexpanthenol	15 mg
Vitamin E ( <i>dl</i> - $\alpha$ tocopheryl acetate)	10 mg
Vitamin K	150 mcg
Folic acid	600 mcg
Biotin	60 mcg
Vitamin B <sub>12</sub> (cyanocobalamin)	5 mcg

The product also contains propylene glycol 30%, polysorbate 80 1.4%, citric acid, and sodium hydroxide and/or hydrochloric acid in water for injection. The concentrated vitamins must be diluted for use; do not give undiluted.<sup>(1-5/07)</sup>

M.V.I.-12 has the same vitamin content as M.V.I. Adult except for the absence of vitamin K.<sup>(1-5/07)</sup>

M.V.I. Pediatric is available as a lyophilized powder in vials containing a single dose. Each single dose contains<sup>(1-5/07)</sup> :

Ascorbic acid	80 mg
Vitamin A (retinol)	0.7 mg
Vitamin D (ergocalciferol)	10 mcg
Thiamine (as hydrochloride)	1.2 mg
Riboflavin (as 5'-phosphate sodium)	1.4 mg
Pyridoxine (as hydrochloride)	1 mg
Niacinamide	17 mg
Dexpanthenol	5 mg
Vitamin E ( <i>dl</i> - $\alpha$ tocopheryl acetate)	7 mg
Biotin	20 mcg
Folic acid	140 mcg
Cyanocobalamin	1 mcg
Phytonadione	200 mcg

M.V.I. Pediatric also contains, in each vial, mannitol 375 mg, polysorbate 80 50 mg, polysorbate 20 0.8 mg, butylated hydroxytoluene 58 mcg, butylated hydroxyanisole 14 mcg, and sodium hydroxide for pH adjustment.<sup>(1-5/07)</sup>

Reconstitute the single-dose vial with 5 mL of sterile water for injection, dextrose 5%, or sodium chloride 0.9% and swirl gently. The solution is ready within three minutes. This solution must be further diluted for use; do not give it undiluted.<sup>(1-5/07)</sup>

**Administration** — Multivitamin infusion preparations are administered by intravenous infusion only. They should not be given by direct intravenous injection. M.V.I. Adult is diluted in not less than 500 mL but preferably 1000 mL of intravenous infusion solution for administration. M.V.I. Pediatric should be added to at least 100 mL of a compatible intravenous infusion solution for administration. (1-5/07)

**Stability** — Multivitamin products for infusion should be stored under refrigeration and protected from light. Since some of the vitamins, especially A, D, and riboflavin, are light sensitive, light protection is necessary. After reconstitution of M.V.I. Pediatric, use of the product without delay is recommended. However, if this is not possible, the manufacturer permits use within a maximum of four hours from the initial penetration of the closure. (1-5/07)

*Light Effects* — The effects of photoirradiation on a FreAmine II-dextrose 10% parenteral nutrition solution containing 1 mL/500 mL of multivitamins (USV) were evaluated. During simulated continuous administration to an infant at 0.156 mL/min, the amino acids were stable when the bottle, infusion tubing, and collection bottle were shielded with foil. Only 20 cm of tubing in the incubator was exposed to light. However, if the flow was stopped, marked reductions in methionine (40%), tryptophan (44%), and histidine (22%) occurred in the solution exposed to light for 24 hours. In a similar solution without vitamins, only the tryptophan concentration decreased. The difference was attributed to the presence of riboflavin, a photosensitizer. The authors recommended administering the multivitamins separately and shielding from light. (833)

The stability of five B vitamins was studied over eight hours in representative parenteral nutrition solutions exposed to fluorescent light, indirect sunlight, or direct sunlight. One 5-mL vial of multivitamin concentrate (Lyphomed) and 1 mg of folic acid (Lederle) were added to a liter of parenteral nutrition solution composed of amino acids 4.25% and dextrose 25% (Travenol) with standard electrolytes and trace elements. The five B vitamins were stable for eight hours at room temperature when exposed to fluorescent light. In addition, folic acid and niacinamide were stable over eight hours in direct or indirect sunlight. Exposure to indirect sunlight appeared to have little or no effect on thiamine hydrochloride and pyridoxine hydrochloride in eight hours, but riboflavin-5'-phosphate lost 47%. Direct sunlight caused a 26% loss of thiamine hydrochloride and an 86% loss of pyridoxine hydrochloride in eight hours. A four-hour exposure of riboflavin-5'-phosphate to direct sunlight resulted in a 98% loss. (842)

A parenteral nutrition solution in glass bottles exposed to sunlight was studied. Vitamin A decomposed rapidly, losing more than 50% in three hours. The decomposition could be slowed by covering the bottle with a light-resistant vinyl bag, resulting in about a 25% loss in three hours. Vitamin E was stable in the parenteral nutrition solution in glass bottles exposed to sunlight, with no loss occurring during six hours of exposure. (1040)

Vitamin A rapidly and significantly decomposes when exposed to daylight. The extent and rate of loss were dependent on the degree of exposure to daylight which, in turn, depended on various factors such as the direction of the radiation, time of day, and climatic conditions. Delivery of less than 10% of the expected amount was reported. (1047) In controlled light experiments, the decomposition initially progressed exponentially. Subsequently, the rate of decomposition slowed. This result was attributed to a protective effect of the degradation products on the remaining vitamin A. The presence of amino acids provided greater protection. Compared to degradation rates in dextrose 5%, decomposition was reduced by up to 50% in some amino acid mixtures. (1048)

The stability of several water-soluble vitamins in dextrose 5% and sodium chloride 0.9% in PVC and ClearFlex containers was evaluated. Thiamine, riboflavin, ascorbic acid, and folic acid were stable at 23 °C when protected from light, exhibiting 10% or less loss in 24 hours. When exposed to light, thiamine and folic acid were stable but ascorbic acid was reduced by approximately 50 to 65% and riboflavin was completely lost. (1509)

The stability of phytonadione in a TPN solution containing amino acids 2%, dextrose 12.5%, "standard" electrolytes, and M.V.I. Pediatric over 24 hours while exposed to light was evaluated. Vitamin loss was about 7% in four hours and 27% in 24 hours. Some loss was attributed to the light

sensitivity of the phytonadione.<sup>(1815)</sup>

Substantial loss of retinol all-*trans* palmitate and phytonadione was reported from both TPN and TNA admixtures due to exposure to sunlight. In three hours of exposure to sunlight, essentially total loss of retinol and 50% loss of phytonadione had occurred. The presence or absence of lipids did not affect stability. In contrast, tocopherol concentrations remained essentially unchanged by exposure to sunlight through 12 hours. The container material used to store the nutrition admixtures affected the concentration of the vitamins as well. Losses were greatest (10 to 25%) in PVC containers and were slightly better in EVA and glass containers.<sup>(2049)</sup>

*Sorption* — The following vitamins did not reveal significant sorption to a PVC plastic test strip in 24 hours<sup>(12)</sup> :

Ascorbic acid

Niacinamide

Pyridoxine hydrochloride

Riboflavin

Thiamine hydrochloride

Vitamin D

Vitamin E acetate

Riboflavin was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>(536) (606)</sup>

Vitamin A (as the acetate) (Sigma) 7.5 mg/L displayed 66.7% sorption to a PVC plastic test strip in 24 hours. The presence of dextrose 5% and sodium chloride 0.9% increased the extent of the sorption.<sup>(12)</sup>

In another report, vitamin A acetate 3 mg/L displayed 78% sorption to 200-mL PVC containers after 24 hours at 25 °C with gentle shaking. The sorption was increased by 10% in sodium chloride 0.9% and by 20% in dextrose 5%.<sup>(133)</sup>

However, vitamin A delivery is also reduced in glass intravenous containers. At a concentration of 10,000 units/L in glass and PVC plastic containers protected from light with aluminum foil, 77 and 71%, respectively, of the vitamin A were delivered over a 10-hour period. Without light protection, 61% was delivered from glass and 49% from PVC plastic containers over a 10-hour period.<sup>(290)</sup>

In another test using multivitamin infusion (USV), one ampul per liter of sodium chloride 0.9% in glass and PVC plastic containers not protected from light, 69.4 and 67.9% of the vitamin A were delivered from glass and PVC containers, respectively, over a 10-hour period. The amount of vitamin A was constant over the test period.<sup>(282)</sup>

The delivery of vitamins A, D, and E from a parenteral nutrition solution composed of 3% amino acid solution (Pharmacia) in dextrose 10% with electrolytes, trace elements, vitamin K, folate, and vitamin B<sub>12</sub> was evaluated. To this solution was added 6 mL of multivitamin infusion (USV). The solution was prepared in PVC bags (Travenol), and administration was simulated through a fluid chamber (Buretrol) and infusion tubing with a 0.5- $\mu$ m filter at 10 mL/hr. During the first 60 to 90 minutes, minimal delivery of the vitamins occurred. This was followed by a rise and plateau in the delivered vitamins, which were attributed to an increasing saturation of adsorptive binding sites in the tubing. The total amounts delivered over 24 hours were 31% for vitamin A, 68% for vitamin D,

and 64% for vitamin E. Sorption of the vitamins was found in the PVC bag, fluid chamber, and tubing. Decomposition was not a factor. <sup>(836)</sup>

A patient receiving 3000 I.U. of retinol daily in a parenteral nutrition solution experienced two episodes of night blindness. The pharmacy prepared the parenteral nutrition solution in 1-L PVC bags in weekly batches and stored them at 4 °C in the dark until use. A subsequent in vitro study showed losses of vitamin A of 23 and 77% in three- and 14-day periods, respectively, under these conditions. About 30% of the lost vitamin A could be extracted from the PVC bag. <sup>(1038)</sup>

Vitamin A was lost from multivitamin infusion (USV) in a neonatal parenteral nutrition solution. The solution was prepared in colorless glass bottles and run through an administration set with a burette (Travenol). The total loss of vitamin A was 75% in 24 hours, with about 16% as decomposition in the glass bottle. The decomposition was not noticeable during the first 12 hours, but then vitamin A levels fell rather precipitously to about one-third of the initial amount. The balance of the loss, averaging about 59%, occurred during transit through the administration set. Removal of the inline filter and treatment of the set with albumin human had no effect on vitamin A delivery. Increasing three- to fourfold the amount of vitamin A was suggested to compensate for the losses. <sup>(1039)</sup>

A 50% loss of vitamin A from a bottle of parenteral nutrition solution prepared with multivitamin infusion (USV) after 5.5 hours of infusion was noted. The amount delivered through an Ivex-2 filter set was only 6.3% of the added amount. Similar quantities were found after 20 hours of infusion. Vitamin A binding to the infusion bottles and tubing was confirmed. <sup>(704)</sup>

Solutions containing multivitamin infusion (USV) spiked with <sup>3</sup>H-labeled retinol in intravenous tubing protected from light and agitated to simulate flow for five hours were evaluated. About half of the vitamin A was lost in 30 minutes, and 88 to 96% was lost in five hours. <sup>(1049)</sup>

The stability of vitamin E (alpha-tocopherol acetate from M.V.I.-1000 or Soluzyme) and selenium (from Selepen) in amino acids (Abbott) and dextrose in PVC bags was studied. Exposure to fluorescent light and room temperature (23 °C) for 24 hours and simulated infusion at 50 mL/hr for eight hours through a Medlon TPN administration set with a 0.22- $\mu$ m filter did not affect the concentrations of vitamin E and selenium. <sup>(1224)</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8 °C for 96 hours with no significant loss of retinyl palmitate, alpha-tocopherol, thiamine mononitrate, sodium riboflavin-5'-phosphate, pyridoxine hydrochloride, nicotinamide, folic acid, biotin, sodium pantothenate, and cyanocobalamin. Sodium ascorbate and its biologically active degradation product, dehydroascorbic acid, totaled 59 and 42% of the nominal starting concentration at 24 and 96 hours, respectively. <sup>(1225)</sup>

When the admixture was subjected to simulated infusion over 24 hours at 20 °C, either exposed to room light or light protected, or stored for six days in the dark under refrigeration and then subjected to the same simulated infusion, once again the retinyl palmitate, alpha-tocopherol, and sodium riboflavin-5'-phosphate did not undergo significant loss. However, sodium ascorbate and its degradation product, dehydroascorbic acid, had initial combined concentrations of 51 to 65% of the nominal initial concentration, with further declines during infusion. Light protection did not significantly alter the loss of total ascorbic acid. <sup>(1225)</sup>

Neonatal parenteral nutrition solutions containing multivitamin infusion prepared in bags were delivered at 10 mL/hr through Buretrol sets (Travenol). The bags and sets were protected from light. About 26% of the vitamin A was lost before the flow was started. At 10 mL/hr, about 67% was lost from the effluent. More rapid flow reduced the extent of loss. Analysis of clinical samples of parenteral nutrition solutions showed losses of 21 to 57% after 20 hours. Because losses after five hours were of the same magnitude, it was concluded that the loss occurs rapidly and is not due to decomposition. <sup>(1049)</sup>

Retinol losses of 40% occurred in two hours and 60% in five hours from parenteral nutrition solutions pumped at 10 mL/hr through standard infusion sets at room temperature. The retinol concentration in the bottle remained constant while the retinol in the effluent decreased.

Antioxidants had no effect. Much of the vitamin A was recoverable from the tubing. <sup>(1050)</sup>

To minimize the importance of this sorption, Allwood suggested using vitamin A palmitate instead of acetate; he stated that vitamin A palmitate does not sorb to PVC. However, this does not alter the problem of degradation from exposure to light. <sup>(1033)</sup>

*Plasticizer Leaching* — Multivitamins (Lyphomed) 1 mL in 50 mL of dextrose 5% leached insignificant amounts of diethylhexyl phthalate (DEHP) plasticizer due to the surfactant polysorbate 80 in the formulation. This finding is consistent with the low surfactant concentration (0.032%) in the admixture solution. <sup>(1683)</sup>

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Concentration unspecified.

<sup>d</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>e</sup>M.V.I.-12.

<sup>f</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>g</sup>Tested in Ringer's injection, lactated.

### **Additional Compatibility Information**

*Parenteral Nutrition Solutions* — In a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, trace elements, and multivitamins in PVC bags stored at 4 and 25 °C, vitamin A rapidly deteriorated to 10% of the initial concentration in eight hours at 25 °C when exposed to light. The decomposition was slowed by light protection and refrigeration, with a loss of about 25% in four days. Folic acid concentration dropped 40% initially on admixture and then remained relatively constant for 28 days of storage. About 35% of the ascorbic acid was lost in 39 hours at 25 °C when exposed to light. The loss was reduced to a negligible amount in four days by refrigeration and light protection. Thiamine content dropped by 50% initially but then remained unchanged over 120 hours of storage. ([1063](#))

The stability of ascorbic acid in parenteral nutrition solutions, with and without fat emulsion, was studied. Both with and without fat emulsion, the total vitamin C content (ascorbic acid plus dehydroascorbic acid) remained above 90% for 12 hours when the solutions were exposed to

fluorescent light and for 24 hours when they were protected from light. When stored in a cool dark place, the solutions were stable for seven days.<sup>(1227)</sup>

Samples from 24 1-L and four 2-L parenteral nutrition solutions, containing one vial each of multivitamin concentrate (USV), were evaluated for thiamine hydrochloride content 48 and 72 hours after mixing. The parenteral nutrition solutions contained amino acids 2.75 to 5%, dextrose 15 to 25%, and electrolytes. Thiamine hydrochloride was stable in all of the solutions tested in spite of approximately 0.05% sulfite content.<sup>(843)</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Nearly all of the vitamins retained their initial concentrations. However, ascorbic acid exhibited losses of about 5%, 13%, and 17% in TPNs with dextrose concentrations of 10, 15, and 25%, respectively.<sup>(2796)</sup>

*Erythromycin* — Erythromycin 5 mg/mL as the lactobionate in pH 8 buffer was combined with riboflavin in concentrations varying from 1 mg/mL to 20 mcg/mL. On exposure to light for four hours, almost total decomposition of the erythromycin occurred, with only 4 to 12% remaining. Protection from light resulted in 12 to 25% decomposition. When no riboflavin was present, 10% or less decomposition of the erythromycin occurred. It was concluded that a photodynamic decomposition reaction was taking place.<sup>(564)</sup>

*Penicillin G* — The times to 10% decomposition of combinations of penicillin G potassium buffered with multivitamin infusion concentrate in dextrose 5% and sodium chloride 0.9% have been calculated on the pH of the admixture<sup>(304)</sup> :

<b>Penicillin G Potassium</b>	<b>Multivitamin Infusion Concentrate</b>	<b>pH</b>	<b>Time to 10% Decomposition</b>
1 million units/L	1 mL/L	5.1	6.51 hr
1 million units/L	5 mL/L	4.9	4.56 hr
3 million units/L	1 mL/L	5.4	13.54 hr
3 million units/L	5 mL/L	5.0	6.38 hr
5 million units/L	1 mL/L	5.7	22.01 hr
5 million units/L	5 mL/L	5.1	6.51 hr
10 million units/L	1 mL/L	5.9	over 24 hr
10 million units/L	5 mL/L	5.4	13.54 hr

## Mycophenolate Mofetil Hydrochloride - AHFS 92:44

**Products** — Mycophenolate mofetil hydrochloride is available as a lyophilized powder in vials containing 500 mg of drug along with polysorbate 80 25 mg and citric acid 5 mg. Sodium hydroxide may have been added during manufacturing to adjust pH. <sup>(1-12/08)</sup>

Dextrose 5% is used for reconstitution and dilution for use to a concentration of 6 mg/mL. Using care and precautions to avoid contact with the drug solution, reconstitute each vial with 14 mL of dextrose 5% and gently shake to dissolve the drug. Dilute the reconstituted solution further with dextrose 5% to yield a 6-mg/mL concentration. The volumes of dextrose 5% to be used for 1- and 1.5-g doses are 140 and 210 mL, respectively. The solution should be inspected for particulate matter and discoloration. <sup>(1-12/08)</sup>

*pH* — From 2.4 to 4.1. <sup>(1-12/08)</sup>

*Trade Name(s)* — CellCept

**Administration** — Mycophenolate mofetil hydrochloride is administered by slow intravenous infusion over a minimum of two hours into either a central line or peripheral vein. The drug should not be administered by rapid or bolus administration. <sup>(1-12/08)</sup>

**Stability** — The intact vials containing mycophenolate mofetil hydrochloride as white to off-white lyophilized powder should be stored at controlled room temperature. Dextrose 5% is recommended for reconstitution and dilution of mycophenolate mofetil hydrochloride. All other solutions are stated to be incompatible. The reconstituted solution and dilution for use are slightly yellow and may also be kept at room temperature. The manufacturer indicates administration should begin within four hours after reconstitution. <sup>(1-12/08)</sup>

Mycophenolate Mofetil Hydrochloride - AHFS 92:44

## Nafcillin Sodium - AHFS 8:12.16.12

**Products** — Nafcillin sodium is available in vials containing the equivalent of 1 and 2 g of nafcillin.<sup>(4)</sup> Reconstitute the 1-g vial with 3.4 mL and the 2-g vial with 6.6 mL of sterile water for injection, sodium chloride 0.9%, or bacteriostatic water for injection containing parabens or benzyl alcohol. The solution then contains nafcillin sodium equivalent to nafcillin 250 mg/mL with sodium citrate buffer. The final volumes of the 1- and 2-g vials are 4 and 8 mL, respectively.<sup>(4)</sup>

A 10-g pharmacy bulk vial is also available and is reconstituted with 93 mL of sterile water for injection or sodium chloride 0.9% to yield a 100-mg/mL solution with sodium citrate buffer 4 mg/mL.<sup>(4)</sup>

Nafcillin sodium is also available as frozen premixed solutions containing 1 and 2 g of nafcillin per minibag in dextrose 3.6% or 2%, respectively.<sup>(1-2/07)</sup>

*pH* — The pH of the reconstituted solution and frozen premixed solution is 6 to 8.5.<sup>(4)</sup>

*Osmolality* — The osmolality of nafcillin sodium 250 mg/mL in sterile water for injection was 709 mOsm/kg by freezing-point depression and 665 mOsm/kg by vapor pressure.<sup>(1071)</sup>

The frozen premixed solutions have an osmolality of 300 mOsm/kg.<sup>(4)</sup>

The osmolality of nafcillin sodium (Wyeth) 40 mg/mL was determined to be 403 mOsm/kg in dextrose 5% and 402 mOsm/kg in sodium chloride 0.9%.<sup>(1375)</sup>

The osmolality of nafcillin sodium was calculated for the following dilutions<sup>(1054)</sup> :

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>2 g</b>		
Dextrose 5%	399	334
Sodium chloride 0.9%	425	361
<b>3 g</b>		
Dextrose 5%	458	371
Sodium chloride 0.9%	485	398

The following maximum nafcillin sodium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients<sup>(1180)</sup> :

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	71	491
Sodium chloride 0.9%	64	470
Sterile water for injection	128	319

*Sodium Content* — Each gram of nafcillin sodium with sodium citrate buffer contains 2.9 mEq (66 mg) of sodium.<sup>(4)</sup> <sup>(27)</sup>

**Administration** — Nafcillin sodium may be administered intramuscularly by deep intragluteal injection, by direct intravenous injection, or by intermittent intravenous infusion. For direct intravenous injection, the dose should be diluted with 15 to 30 mL of sterile water for injection or

sodium chloride 0.45 or 0.9% and given over five to 10 minutes into the tubing of a running intravenous infusion. Intermittent intravenous infusion in a concentration between 2 and 40 mg/mL should be administered slowly, over 30 to 60 minutes.<sup>(4)</sup>

**Stability** — Intact containers should be stored at controlled room temperature or lower.<sup>(4)</sup> When reconstituted to a concentration of 250 mg/mL, nafcillin sodium is stable for three days at room temperature or seven days when refrigerated at 2 to 8 °C.<sup>(4)</sup> <sup>(27)</sup> At concentrations of 2 to 40 mg/mL, nafcillin sodium is stable for 24 hours at room temperature or 96 hours under refrigeration.<sup>(4)</sup>

Commercially available frozen premixed nafcillin sodium solutions, thawed at room temperature or under refrigeration, are stable for 72 hours at 25 °C and 21 days at 5 °C.<sup>(4)</sup>

The activity of nafcillin 100 mg/L was evaluated in peritoneal dialysis fluids containing dextrose 1.5 or 4.25% (Dianeal 137, Travenol). Storage at 25 °C resulted in no loss of antimicrobial activity in 24 hours.<sup>(515)</sup>

The stability of nafcillin sodium (Wyeth) 100 mg/L in peritoneal dialysis solutions (Dianeal 137 and PD2) with heparin sodium 500 units/L was evaluated. About 98% activity remained after 24 hours at 25 °C.<sup>(1228)</sup>

*pH Effects* — The stability of nafcillin sodium is pH dependent, with a maximum stability at pH 6 and a preferred range of pH 5 to 8. Drug decomposition is increased as pH values vary from this range. Additives that may result in a final pH of above 8 or below 5 should not be mixed with nafcillin sodium.<sup>(27)</sup>

*Freezing Solutions* — At a concentration of 250 mg/mL in sterile water for injection and frozen at -20 °C, the drug is stable for up to three months.<sup>(27)</sup> <sup>(123)</sup>

In one study, however, when nafcillin sodium (Wyeth) 1 g/4 mL was frozen at -20 °C in glass syringes (Hy-Pod), the drug was stable for nine months.<sup>(532)</sup>

In another study, nafcillin sodium (Wyeth) 1 g/50 mL of dextrose 5% in PVC bags frozen at -20 °C for 30 days and then thawed by exposure to ambient temperature or microwave radiation showed no evidence of precipitation or color change but had a 2 to 3% loss. Subsequent storage of the admixture at room temperature for 24 hours also yielded physically compatible solutions with no additional loss of activity.<sup>(555)</sup>

*Syringes* — Nafcillin sodium (Apothecon) 10 mg/mL in sodium chloride 0.9% was packaged in 10-mL polypropylene syringes (Becton Dickinson) and stored at 5 and 25 °C. The solutions remained clear under refrigeration for 44 days and at room temperature for seven days. A yellow color developed after 14 days at room temperature. About 2% loss of nafcillin sodium occurred after seven days and 18% loss in 14 days at 25 °C. Under refrigeration, 1% loss occurred after 44 days. Stability in glass containers was comparable.<sup>(2325)</sup>

*Ambulatory Pumps* — Nafcillin sodium (Marsam) 20 mg/mL in sterile water for injection in PVC portable pump reservoirs (Pharmacia Deltec) exhibited no loss in three days stored at 25 °C and in 14 days at 5 °C. However, at a concentration of 120 mg/mL, 6% loss was found in three days at 25 °C, and 2% loss occurred in 14 days at 5 °C.<sup>(2080)</sup>

Nafcillin sodium 40 and 50 mg/mL in sodium chloride 0.9% precipitated in as little as one day at the simulated ambulatory use temperature of 35 °C. At 20 mg/mL, precipitation appeared in three days. When stored at room temperature, no precipitation appeared at any concentration in three days.<sup>(2664)</sup>

## **Compatibility Information**

Vancomycin HCl	AB	2 mg/mL <sup>a</sup>	BE	1 mg/mL <sup>b</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2189</a>	C
Verapamil HCl		<sup>h</sup>			White milky precipitate forms immediately	<a href="#">840</a> <a href="#">1303</a>	I
Verapamil HCl	SE	2.5 mg/mL	WY	40 mg/mL <sup>c</sup>	White precipitate forms immediately. 20% of verapamil precipitated	<a href="#">1166</a>	I
Zidovudine	BW	4 mg/mL <sup>a</sup>	BR	20 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 25 °C	<a href="#">1193</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>e</sup>Run at 21 mL/hr.

<sup>f</sup>Given over five minutes by syringe pump.

<sup>g</sup>Run at 94 mL/hr.

<sup>h</sup>Injected into a line being used to infuse nafcillin sodium.

<sup>i</sup>Tested in sterile water for injection.

## Nalbuphine Hydrochloride - AHFS 28:08.12

**Products** — Nalbuphine hydrochloride is available as a 10-mg/mL concentration in 1-mL ampuls and 10-mL vials and as a 20-mg/mL concentration in 1-mL ampuls and 10-mL vials. Each milliliter of solution in vials also contains sodium citrate hydrous 0.94%, citric acid anhydrous 1.26%, methyl- and propylparabens 0.2%, and hydrochloric acid to adjust pH. The 10-mg/mL solution contains sodium chloride 0.225%. The ampul formulation contains no parabens. <sup>(1-6/06)</sup>

*pH* — The pH is adjusted to about pH 3.5 to 3.7. <sup>(1-6/06)</sup>

**Administration** — Nalbuphine hydrochloride is administered by subcutaneous, intramuscular, or intravenous injection. <sup>(1-6/06)</sup> (4)

**Stability** — Intact vials and ampuls should be protected from excessive light and stored at 15 to 30 °C. <sup>(1-6/06)</sup> (4)

*Central Venous Catheter* — Nalbuphine hydrochloride (Astra) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

Nalbuphine Hydrochloride - AHFS 28:08.12

## Naloxone Hydrochloride - AHFS 28:10

**Products** — Naloxone hydrochloride is available in the following formulations<sup>(1-6/06)</sup> :

Component	Preserved (mg/mL)		Paraben-Free (mg/mL)		
	1	0.4	1	0.4	0.02
Naloxone HCl	1	0.4	1	0.4	0.02
Sodium chloride	8.35	8.6	9	9	9
Methyl- and propylparabens (9:1)	2	2			
Sizes (mL)	10	10	2	1	2

*pH* — The pH is adjusted during manufacturing with hydrochloric acid to a target pH of 3 to 4 (1-6/06) with a range of 3 to 6.5.<sup>(17)</sup>

*Osmolality* — The osmolality of the 0.02-mg/mL concentration was determined to be 293 mOsm/kg by freezing-point depression and 289 mOsm/kg by vapor pressure.<sup>(1071)</sup>

The osmolality of naloxone hydrochloride 0.4 mg/mL was determined to be 301 mOsm/kg.<sup>(1233)</sup>

*Trade Name(s)* — Narcan

**Administration** — Naloxone hydrochloride may be administered by subcutaneous, intramuscular, or intravenous injection or by continuous intravenous infusion. Solutions for continuous intravenous infusion may be prepared as 2 mg/500 mL (4 mcg/mL) of sodium chloride 0.9% or dextrose 5%.<sup>(1-6/06)</sup> (4)

**Stability** — Naloxone hydrochloride should be stored at room temperature and protected from excessive light. Naloxone hydrochloride should not be mixed with bisulfite, sulfite, or long-chain or high molecular weight anions or any solution with an alkaline pH.<sup>(1-6/06)</sup> (4)

Naloxone hydrochloride under simulated summer conditions in paramedic vehicles was exposed to 26 to 38 °C over four weeks. Analysis found no loss of the drug under these conditions.<sup>(2562)</sup>

*Syringes* — Naloxone hydrochloride (Astra) 0.133 mg/mL in sodium chloride 0.9% packaged in polypropylene syringes (Sherwood) was physically stable and exhibited little or no loss in 24 hours stored at 4 and 23 °C.<sup>(2199)</sup>

Naloxone Hydrochloride - AHFS 28:10

## Neostigmine Methylsulfate - AHFS 12:04

**Products** — Neostigmine methylsulfate is available in concentrations of 0.5 and 1 mg/mL in 10-mL vials with methyl- and propylparabens 0.2%.<sup>(1-6/06)</sup>

*pH* — The pH is adjusted to near 5.9 with a range of 5 to 6.5.<sup>(1-6/06)</sup> (17)

**Administration** — Neostigmine methylsulfate may be administered intramuscularly, subcutaneously, or slowly intravenously.<sup>(1-6/06)</sup> (4)

**Stability** — Neostigmine methylsulfate in intact containers should be stored at controlled room temperature and protected from light, freezing, and temperatures of 40 °C or more.<sup>(1-6/06)</sup> (4)

*Syringes* — The stability of neostigmine 0.5 mg/mL repackaged in polypropylene syringes was evaluated. Little concentration change was found after four weeks of storage at room temperature not exposed to direct light.<sup>(2164)</sup>

Neostigmine methylsulfate (Elkins-Sinn) 0.167 mg/mL in sodium chloride 0.9% packaged in polypropylene syringes (Sherwood) was physically stable and exhibited no loss in 24 hours stored at 4 and 23 °C.<sup>(2199)</sup>

Undiluted neostigmine methylsulfate (American Pharmaceutical Partners) 1 mg/mL was packaged in 6-mL polypropylene syringes (Becton Dickinson) and stored at 23 °C in fluorescent light and at 4 °C for 90 days. The drug remained physically stable and under 2% loss occurred.<sup>(2425)</sup>

Neostigmine Methylsulfate - AHFS 12:04

## Nesiritide - AHFS 24:12.92

**Products** — Nesiritide is available in 1.5-mg single-use vials containing 1.58 mg of nesiritide with mannitol 20 mg, citric acid monohydrate 2.1 mg, and sodium citrate dihydrate 2.94 mg. <sup>(1-1/07)</sup>

Reconstitute nesiritide using 5 mL of solution from a 250-mL plastic intravenous infusion container of dextrose 5%, sodium chloride 0.9%, dextrose 5% in sodium chloride 0.45%, or dextrose 5% in sodium chloride 0.2%, yielding a nesiritide concentration of 0.32 mg/mL. Gently rock the vial to aid dissolution making sure all surfaces, including the stopper, are in contact with the diluent; do not shake the vial. The reconstituted solution should be clear and colorless. Add the entire contents of the vial into the 250-mL plastic infusion solution container and invert several times to yield a nesiritide infusion concentration of 6 mcg/mL. <sup>(1-1/07)</sup>

**Trade Name(s)** — Natreacor

**Administration** — Nesiritide is administered by an initial intravenous injection drawn from the intravenous infusion solution and given over about one minute followed by continuous intravenous infusion. The intravenous tubing should be primed with 5 mL of the solution before connecting to the patient's access port and before administering the initial bolus dose or beginning the infusion. <sup>(1-1/07)</sup>

**Stability** — Intact vials should be stored below 25 °C in the original carton to protect from light. Protect the vials from freezing. <sup>(1-1/07)</sup>

The manufacturer states that the reconstituted nesiritide should be used within 24 hours stored between 2 and 25 °C because no antimicrobial preservative is present. <sup>(1-1/07)</sup>

Nesiritide is incompatible with sodium metabisulfite and other bisulfite antioxidants used in some drug formulations. The specific formulation of the product to be used should be checked to ensure that no sulfite antioxidants are present. Drugs that contain sulfite antioxidants should not be administered into the same intravenous infusion line as nesiritide. The line should be flushed between administration of the incompatible drugs and nesiritide. <sup>(1-1/07)</sup> (2625)

**Sorption** — The official product labeling states that nesiritide may bind to heparin-coated administration catheters decreasing the delivery of nesiritide to the patient and that heparin-coated administration lines must not be used to administer nesiritide. <sup>(1-1/07)</sup>

However, a study of nesiritide delivery through unprimed PVC and polyethylene tubing, a polyurethane central catheter, and a heparin-coated PVC catheter found little alteration of the delivered concentration. About 94 to 98% of the drug was delivered through these devices compared to 98% through primed PVC tubing alone. <sup>(2646)</sup>

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Nesiritide is incompatible with bisulfite antioxidants used in some drug formulations. The specific formulation of the product to be used should be checked to ensure that no sulfite antioxidants are present.

Nesiritide - AHFS 24:12.92

## Nicardipine Hydrochloride - AHFS 24:28.08

**Products** — Nicardipine hydrochloride is available as a 2.5-mg/mL concentrate in 10-mL ampuls. Each milliliter also contains sorbitol 48 mg, citric acid monohydrate 0.525 mg, and sodium hydroxide 0.09 mg in water for injection. Additional citric acid and/or sodium hydroxide may have been added to adjust solution pH. [\(1-1/06\)](#)

*pH* — Buffered to pH 3.5. [\(1-1/06\)](#)

*Trade Name(s)* — Cardene I.V.

**Administration** — Nicardipine hydrochloride must be diluted for use. It is administered as a slow continuous intravenous infusion at a concentration of 0.1 mg/mL. The infusion is prepared by adding 10 mL of nicardipine hydrochloride (25 mg) to 240 mL of compatible infusion solution, making 250 mL of a 0.1-mg/mL solution. If nicardipine hydrochloride is administered via a peripheral vein, the infusion site should be changed every 12 hours to avoid venous irritation. [\(1-1/06\)](#) (4)

**Stability** — Intact ampuls of the clear, yellow solution should be stored at controlled room temperature and protected from light. Freezing does not adversely affect the product, but exposure to elevated temperatures should be avoided. [\(1-1/06\)](#)

*Light Effects* — Deliberate exposure of a 0.1-mg/mL nicardipine hydrochloride solution to daylight resulted in about 8% loss in seven hours and 21% loss in 14 hours. Protection from light may be considered. [\(2193\)](#)

*Sorption* — Nicardipine hydrochloride (Dupont Merck) 50 and 500 mg/L in a variety of infusion solutions in PVC containers showed a decline in concentration due to sorption to the plastic. Losses were rapid in Ringer's injection, lactated with up to 42% lost in 24 hours. The concentrations were stable in glass containers. [\(1380\)](#)

## Nimodipine - AHFS 24:28.08

**Products** — Nimodipine 0.02% (0.2 mg/mL) is available in 50-mL brown glass vials and 250-mL brown glass bottles. The product also contains ethanol 20% (w/v), polyethylene glycol 400, sodium citrate, citric acid, and water for injection. <sup>(38)</sup> <sup>(115)</sup>

**Administration** — Nimodipine is given by intravenous infusion via a central catheter<sup>(38)</sup> <sup>(115)</sup>; use of an infusion pump has been recommended.<sup>(115)</sup> Intracisternal instillation has also been described.<sup>(115)</sup> The drug must not be added to an infusion bag or bottle. For administration, nimodipine injection is drawn into a 50-mL syringe and connected to a three-way stopcock and polyethylene tube that permits simultaneous administration of the nimodipine and a co-infusion running at a rate of 40 mL/hr. Dextrose 5%, sodium chloride 0.9%, lactated Ringer's injection, lactated Ringer's injection with magnesium, dextran 40, mannitol 10%, albumin human 5%, and hetastarch 6% in sodium chloride 0.9% have been recommended for use as the co-infusion solution.<sup>(38)</sup> <sup>(115)</sup>

**Stability** — Nimodipine injection is a clear yellow solution. Intact containers of the drug should be stored at or below 25 °C. The drug is light sensitive and should be stored in the light-protective container within the carton that is supplied with the product. Nimodipine should not be added to infusion solution bags or bottles or mixed with other drugs. The 250-mL bottles are intended for single use only and should be pierced only once. Once pierced, the bottle should be used for no longer than 25 hours regardless of whether all of the solution has been administered.<sup>(38)</sup> <sup>(115)</sup>

**Light Effects** — Nimodipine is light sensitive. The drug drawn into a syringe for administration must be protected from direct sunlight during administration but is stable for up to 10 hours exposed to diffuse daylight and artificial light. The 250-mL infusion bottle should also be protected from direct sunlight at all times. Opaque coverings for infusion pumps and tubing or black, brown, yellow, or red infusion lines can be used when needed.<sup>(38)</sup> <sup>(115)</sup>

**Sorption** — Nimodipine reacts with PVC equipment but is compatible with polyethylene and polypropylene containers, syringes, and administration sets as well as glass containers.<sup>(38)</sup> <sup>(115)</sup>

Nimodipine (Bayer) 0.01 mg/mL in dextrose 5% and sodium chloride 0.9% packaged in PVC, polyethylene, and glass containers exhibited only 3 to 5% loss in glass and polyethylene containers but 94% loss due to sorption in PVC containers when stored at 4 and 22 °C for 24 hours protected from light.<sup>(2289)</sup>

## Nitroglycerin - AHFS 24:12.08

**Products** — Nitroglycerin injection is available in a 5-mg/mL concentration in 5- and 10-mL vials. The product also contains ethanol 30% and propylene glycol 30% in water for injection. The pH may have been adjusted during manufacture with sodium hydroxide and/or hydrochloric acid. Nitroglycerin injection must be diluted before use. <sup>(1-10/06)</sup> (4)

Nitroglycerin is available premixed in dextrose 5% at concentrations of 100, 200, and 400 mcg/mL in 250- and 500-mL containers. The Baxter premixed infusions contain propylene glycol and ethanol with citric acid as a buffer and sodium hydroxide and/or hydrochloric acid, if necessary, to adjust the pH during manufacturing. The Hospira premixed infusions also contain propylene glycol (but no ethanol) and nitric acid to adjust pH during manufacturing. <sup>(1-10/06)</sup>

*pH* — The concentrate for injection has a pH of 3 to 6.5. <sup>(1-10/06)</sup> (4) The Baxter premixed infusion solution has a pH of 4 (range 3 to 5). The Hospira premixed infusion solution also has a pH of about 4 but with a range of 3 to 6.5. <sup>(1-10/06)</sup>

*Osmolarity* — The osmolarities of the nitroglycerin premixed infusions solutions in dextrose 5% vary by manufacturer but are all within the normal range for infusions <sup>(1-10/06)</sup> :

Nitroglycerin Concentration	Osmolarity (mOsm/L)	
	Hospira	Baxter
100 mcg/mL	265	428
200 mcg/mL	277	440
400 mcg/mL	301	465

**Administration** — Nitroglycerin injection is administered by intravenous infusion after dilution in dextrose 5% or sodium chloride 0.9% contained in glass bottles, using an infusion control device. The use of filters should be avoided. Various concentrations and administration rates are utilized, depending on the fluid requirements of the patient and the duration of therapy. An initial concentration of 50 to 100 mcg/mL, with adjustment to the concentration if necessary, has been recommended. The concentration should not exceed 400 mcg/mL. <sup>(1-10/06)</sup> (4)

Because of nitroglycerin sorption into PVC plastic, dosing is higher with standard PVC administration sets and should be reduced when nonabsorbing administration sets are used. <sup>(4)</sup>

Inaccurate nitroglycerin dosing may occur with nonabsorbing high-density polyethylene plastic administration sets. Such tubing is less pliable than PVC and may not work well with some infusion control devices designed for PVC tubing, resulting in overinfusion. <sup>(729)</sup> <sup>(730)</sup> <sup>(731)</sup> <sup>(1120)</sup>

**Stability** — Nitroglycerin injections are practically colorless and stable in the intact containers. The solutions are not explosive. Storage should be at controlled room temperature; the containers should be protected from freezing. <sup>(1-10/06)</sup> (4) Exposure to light, even high intensity light, does not adversely affect nitroglycerin stability. <sup>(506)</sup> <sup>(510)</sup> <sup>(928)</sup> <sup>(930)</sup> <sup>(1941)</sup>

*pH Effects* — The rate of nitroglycerin hydrolysis becomes significant at low pH values and is also quite rapid in alkaline solutions. <sup>(933)</sup> In neutral to weakly acidic solutions, the drug is stable. No loss was observed over 136 days at room temperature at pH 3 to 5. <sup>(1072)</sup>

*Syringes* — Plastic syringes having polypropylene barrels and polyethylene plungers (Pharma-Plast) and all-glass containers were compared in an investigation of the possible sorption of nitroglycerin. After 24 hours of storage of aqueous nitroglycerin solutions (concentrations unspecified), no drug loss was found in either the plastic syringes or glass containers. The authors indicated that these

plastic syringes could be substituted for glass syringes for use with syringe pumps.<sup>(782)</sup>

Nitroglycerin (DuPont) (concentration unspecified) was filled into 3-mL plastic syringes (Becton Dickinson, Sherwood Monoject, and Terumo) and stored at -20, 4, and 25 °C in the dark. Nitroglycerin losses in one day ranged from 10 to 15% at 25 °C, to 2 to 3% at 4 °C, to 2% or less at -20 °C. Long-term storage for seven days at 4 °C and 30 days at -20 °C resulted in losses of 5 to 7% and 2% or less, respectively. The losses were presumably due to sorption to surfaces and/or the elastomeric plunger.<sup>(1562)</sup>

Nitroglycerin (DuPont) 50 mg/50 mL in dextrose 5% exhibited no change in appearance and about a 3.6% loss when stored in 60-mL plastic syringes (Becton Dickinson) for 24 hours at 25 °C.<sup>(1579)</sup>

Nitroglycerin concentrate 5 mg/mL from four manufacturers (Abbott, DuPont, Goldline, Marion) was filled as 10 mL in 10-mL glass syringes (Becton Dickinson) and in 10-mL (Becton Dickinson) and 12-mL (Monoject) polypropylene plastic syringes. No loss of nitroglycerin content occurred in 23 hours when stored at 25 °C protected from light. Mean nitroglycerin concentrations were greater than 99% and were the same for both the glass and plastic syringes.<sup>(2055)</sup>

*Sorption* — Nitroglycerin readily undergoes sorption to many soft plastics, especially PVC which is commonly used to make infusion solution bags and intravenous tubing.

Plastics such as polyethylene and polypropylene generally do not absorb nitroglycerin. Consequently, it is recommended that only infusion solution containers made from glass or a plastic known to be compatible with nitroglycerin (i.e., polyolefin) be used for mixing infusions.

To circumvent the significant loss to PVC tubing, use of the special high-density polyethylene administration sets provided by the various nitroglycerin injection manufacturers is recommended. Nitroglycerin is not significantly sorbed to these special sets, but the rate of loss to conventional PVC sets is significant (40 to 80%), although not constant nor self-limiting. Many factors including flow rate, concentration, and length of the set affect the extent of sorption. The greatest amount of sorption occurs early in the infusion. A slow rate of flow and long tubing length increase the loss. Simple calculations or corrections cannot be applied to this complex phenomenon to determine or control the actual amount of nitroglycerin delivered through PVC tubing.<sup>(1-10/06) (4) (503) (506) (508) (509) (510) (511) (721) (723) (724) (725) (726) (727) (728) (769) (770) (797) (930) (931) (932) (934) (943) (1027) (1121) (1122) (1392) (1510) (1511) (1512) (1796) (2143) (2289) (2660) (2792)</sup>

In addition to PVC bags and infusion tubing, nitroglycerin has been demonstrated to undergo similar sorption to cellulose propionate drip chambers<sup>(725) (931) (1027) (1512)</sup>, polystyrolbutadiene burettes<sup>(1512)</sup>, PVC pulmonary artery catheters<sup>(937)</sup> and central venous pressure catheters (Intracath, Deseret)<sup>(938)</sup>, a polyurethane sponge used to defoam blood in a bubble oxygenator<sup>(939)</sup>, a silicone rubber membrane in a membrane oxygenator<sup>(940)</sup>, an infusion pump cassette (Accuset C-924, IMED)<sup>(941)</sup>, and silicone rubber microbore intravenous infusion tubing.<sup>(942)</sup>

However, the clinical importance of the sorption to PVC has been questioned because nitroglycerin administration is titrated to clinical response, not in a fixed dosage.<sup>(1120) (1123) (2015) (2016) (2054)</sup> A 25 to 35% loss to PVC tubing was reported at rates of nitroglycerin administration of 80 and 60 mcg/min, respectively. Polyethylene tubing delivered essentially 100% of the nitroglycerin. Nevertheless, there was no statistically significant difference in physiologic response in patients when a variety of parameters were evaluated. The type of tubing used does not influence the ultimate hemodynamic responses significantly, because even the PVC delivered a significant amount of the drug. It was advised that physiologic endpoints be monitored in patients on intravenous nitroglycerin.<sup>(1120)</sup>

A number of similar results were also reported.<sup>(2015) (2016) (2054)</sup> Adequate clinical response was achieved using PVC containers and tubing. However, changes in patient hemodynamic status could

occur if containers for nitroglycerin infusions were changed during the treatment course; switching from PVC to glass or vice versa could require substantial adjustment in the rate of administration to achieve a similar clinical response.<sup>(2016)</sup>

**Filtration** — Some filters absorb nitroglycerin and should be avoided.<sup>(4)</sup> Filtration of 250 mL of a 485-mcg/mL aqueous solution through three different 142-mm, 0.2- $\mu$ m filters was performed. A loss of 55% resulted with the Gelman GA filter composed of cellulose triacetate. Losses of only 5% occurred with a Millipore GS filter (a mixture of cellulose acetate and cellulose nitrate), and 2% losses occurred with a Gelman Tuffryn filter (a high-temperature aromatic polymer).<sup>(724)</sup>

In one study, a filter material specially treated with a proprietary agent was evaluated for a possible reduction in nitroglycerin binding. Nitroglycerin (Abbott) 62.5 mg/250 mL in dextrose 5% and in sodium chloride 0.9% was run through an administration set with a treated 0.22- $\mu$ m cellulose ester inline filter at a rate of 3 mL/min. Cumulative nitroglycerin losses of less than 6% occurred from 200 mL of either solution. However, equilibrium binding studies showed no significant differences in drug affinity between treated and untreated filter material in either solution.<sup>(904)</sup> Ivex integral filter and extension sets use the treated filter material.<sup>(1074)</sup>

## Compatibility Information

### Solution Compatibility

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in sterile water for injection.

<sup>e</sup>Tested using Baxter Healthcare premixed nitroglycerin infusion in dextrose 5% with citrate buffer.

<sup>f</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>g</sup>Tested in dextrose 5% in sodium chloride 0.2%.

<sup>h</sup>Test performed using the formulation WITHOUT edetate disodium.

## Norepinephrine Bitartrate (NORADRENALINE ACID TARTRATE) - AHFS 12:12

**Products** — Norepinephrine bitartrate is available as 1 mg/mL of norepinephrine base in 4-mL vials. Each milliliter of solution also contains sodium metabisulfite 0.2 mg and sodium chloride for isotonicity in water for injection. <sup>(1-6/07)</sup>

*pH* — From 3 to 4.5. <sup>(1-6/07)</sup> <sup>(77)</sup>

*Osmolality* — Norepinephrine bitartrate injection is adjusted to isotonicity with sodium chloride. <sup>(1-6/07)</sup>

*Trade Name(s)* — Levophed

**Administration** — Norepinephrine bitartrate is administered by intravenous infusion into a large vein, using a pump or other flow rate control device. Extravasation may cause tissue damage and should be avoided. A 4-mcg/mL dilution of norepinephrine base for infusion is usually prepared by adding 4 mg of base (4 mL) to 1000 mL of dextrose 5% with or without sodium chloride. The concentration and infusion rate depend on the patient's requirements. <sup>(1-6/07)</sup> <sup>(4)</sup>

**Stability** — Norepinephrine bitartrate in intact containers should be stored at controlled room temperature and protected from light. <sup>(1-6/07)</sup> <sup>(4)</sup> Dextrose 5% and dextrose 5% in sodium chloride 0.9% are the recommended diluents for infusion because their dextrose content provides protection against significant drug loss due to oxidation. The drug gradually darkens upon exposure to light or air and must not be used if it is discolored or has a precipitate. <sup>(4)</sup>

*pH Effects* — Norepinephrine bitartrate is stable at pH 3.6 to 6 in dextrose 5%. <sup>(48)</sup> <sup>(77)</sup> The pH of a solution is the primary determinant of catecholamine stability in intravenous admixtures. <sup>(527)</sup> At a concentration of 5 mg/L in dextrose 5% at pH 6.5, norepinephrine bitartrate loses 5% in six hours; at pH 7.5, it loses 5% in four hours. <sup>(77)</sup> The rate of loss also increases with exposure to increasing temperatures. <sup>(1929)</sup>

Caution should be employed in mixing additives that may result in a final pH above 6 since norepinephrine bitartrate is alkali labile. <sup>(6)</sup> <sup>(24)</sup> <sup>(77)</sup>

Visual inspection for color change may be inadequate to assess compatibility of admixtures. In one evaluation with aminophylline stored at 25 °C, a color change was not noted until 48 hours had elapsed. However, no intact norepinephrine bitartrate was present in the admixture at 48 hours. <sup>(527)</sup>

*Filtration* — Norepinephrine bitartrate 4 mg/L in dextrose 5% and sodium chloride 0.9% was filtered at a rate of 120 mL/hr for six hours through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2). No significant drug loss due to binding to the filter was noted. <sup>(533)</sup>

*Central Venous Catheter* — Norepinephrine bitartrate 0.1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

### **Compatibility Information**

#### **Solution Compatibility**

Norepinephrine Bitartrate (NORADRENALINE ACID TARTRATE) - AHFS  
12:12

## Octreotide Acetate - AHFS 92:92

**Products** — Octreotide acetate injection is available in 1-mL ampuls containing 0.05 mg (50 mcg), 0.1 mg (100 mcg), and 0.5 (500 mcg) mg of octreotide and in 5-mL multiple-dose vials containing 0.2 mg (200 mcg) and 1 (1000 mcg) mg/mL of octreotide. <sup>(1-1/09)</sup>

The Sandostatin (Sandoz) products also contain in each milliliter lactic acid 3.4 mg, mannitol 45 mg, phenol 5 mg (vial only), and sodium bicarbonate to adjust pH in water for injection. <sup>(1-1/09)</sup>

Octreotide acetate (Bedford) has a differing formulation. In addition to the octreotide acetate, the Bedford formulation in ampuls and multidose vials contains in each milliliter l-lactic acid 3 mg and sodium chloride 7 mg with sodium hydroxide for pH adjustment in water for injection. The multidose vials also contain phenol 5 mg/mL as a preservative. <sup>(1-1/09)</sup>

*pH* — From 3.9 to 4.5. <sup>(1-1/09)</sup>

*Trade Name(s)* — Sandostatin

**Administration** — Octreotide acetate injection is usually administered by subcutaneous injection in the smallest volume that will deliver the dose. Subcutaneous injection sites should be rotated. Multiple subcutaneous injections at the same site within a short time should be avoided. Administration by intravenous injection over three minutes or by infusion over 15 to 30 minutes after further dilution with 50 to 200 mL of dextrose 5% or sodium chloride 0.9% also has been recommended. <sup>(1-1/09)</sup> (4) NOTE: Do not confuse octreotide acetate injection with the injectable depot suspension product, which cannot be given by these routes of administration. <sup>(1-1/09)</sup>

**Stability** — Octreotide acetate injection is a clear solution. Ampuls and vials should be stored under refrigeration and protected from light. However, octreotide acetate injection can be stored at room temperature for up to 14 days when protected from light. <sup>(1-1/09)</sup> (4)

The manufacturers state that octreotide acetate injection should not be added to total parenteral nutrition solutions because of the formation of a glycosyl octreotide conjugate that may decrease the product's efficacy <sup>(1-1/09)</sup>, although the clinical value of this administration approach continues to be debated. <sup>(2136)</sup>

*Syringes* — In Travenol, Minimed, and Becton Dickinson plastic syringes of polypropylene and natural rubber, octreotide 100 and 500 mcg/mL as the acetate was stable for 30 days. <sup>(1370)</sup>

The stability of octreotide acetate injection (Sandoz) 0.2 mg/mL packaged 1 mL in 3-mL polypropylene syringes sealed with tip caps (Becton Dickinson) was evaluated at 3 and 23 °C both exposed to and protected from normal room light. No octreotide acetate loss was found in 29 days stored at 3 °C protected from light but about 7 to 9% loss occurred in 15 to 22 days exposed to light. At 23 °C, the drug was less stable. Although results were variable, more than 10% loss occurred in about two weeks. Maximum storage of one week at 23 °C, whether protected from light or not was recommended. <sup>(2020)</sup>

In a similar study, the stability of octreotide acetate injection (Sandoz) 0.2 mg/mL was evaluated for 60 days stored at 5 and -20 °C (light conditions were not stated). The undiluted octreotide acetate injection was packaged 1 mL in 3-mL polypropylene syringes (Terumo) and sealed with a cap. A loss of about 6% at both storage conditions after 60 days was found. <sup>(2021)</sup>

*Sorption* — The manufacturer indicates that octreotide, a peptide, has the potential for adsorption to plastic and, possibly, glass. <sup>(1540)</sup> However, in both static and dynamic tests, octreotide did not adsorb to Travenol, Minimed, and Becton Dickinson (Plastipak) syringes of polypropylene and natural rubber, Travenol 3-mL insulin pump containers of polypropylene and polycarbonate, and Microflex

PVC and Minimed polyolefin-lined PVC administration tubing.<sup>(1370)</sup> Neither was it adsorbed to glass infusion bottles or a PVC administration set at a concentration of 5 mcg/mL in sodium chloride 0.9%.<sup>(1371)</sup>

**Compatibility Information**

**Solution Compatibility**

**Octreotide acetate**

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Sodium chloride 0.9%	TR <sup>a</sup>	SZ	1.5 mg	Little octreotide loss over 48 hr at room temperature in ambient room light	<a href="#">1373</a>	C
Sodium chloride 0.9%		SZ	5, 50, 250 mg	Physically compatible with no octreotide loss in 96 hr at room temperature exposed to light	<a href="#">1372</a>	C
TNA #139 <sup>b</sup>	<sup>c</sup>	SZ	450 mcg	Physically compatible with no change in lipid particle size in 48 hr at 22 °C under fluorescent light and 7 days at 4 °C. Octreotide activity highly variable	<a href="#">1540</a>	?
TPN #119, #120 <sup>b</sup>	<sup>a</sup>	SZ	1.5 mg	Little octreotide loss over 48 hr at room temperature in ambient room light	<a href="#">1373</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>c</sup>Tested in both glass and ethylene vinyl acetate (EVA) containers.

Octreotide Acetate - AHFS 92:92

## Omeprazole - AHFS 56:28.36

**Products** — Omeprazole infusion is available in vials containing 40 mg of drug as the sodium salt. Also present in the formulation are sodium hydroxide and disodium edetate. Reconstitute the vials with 5 mL from a 100-mL bag or bottle of sodium chloride 0.9% or dextrose 5%. Mix thoroughly, ensuring that all of the omeprazole has dissolved; do not use if any particles remain in the reconstituted solution. The reconstituted solution should be transferred into the infusion bag or bottle making 100 mL of the admixture solution. <sup>(38) (115)</sup>

Omeprazole injection is also available in vials containing 40 mg of drug as the sodium salt with an accompanying 10-mL ampul of special solvent. Each milliliter of the solvent contains citric acid monohydrate 0.5 mg and polyethylene glycol 400 0.4 g in water for injection. The vial of omeprazole should be reconstituted with 10 mL of the solvent provided in the accompanying ampul in two 5-mL increments withdrawing air pressure back into the syringe between the increments. No other diluent should be used for reconstitution. Rotate and shake the vial to ensure all of the omeprazole has dissolved; do not use if any particles remain in the reconstituted solution. <sup>(38) (115)</sup>

**Sodium Content** — Omeprazole 40 mg provides sodium 2.6 mg. <sup>(115)</sup>

**Trade Name(s)** — Losec, Mopral, Omeprazen

**Administration** — Omeprazole is administered by intravenous infusion and intravenous injection. The drug must not be given by any other route. <sup>(38) (115)</sup>

After dilution of the omeprazole infusion to 100 mL with sodium chloride 0.9% or dextrose 5%, omeprazole is administered only as a 20- to 30-minute intravenous infusion. <sup>(38) (115)</sup>

After dilution with the accompanying special diluent, omeprazole injection is administered intravenously over 2.5 to 5 minutes at a maximum rate of 4 mL/min. <sup>(38) (115)</sup>

**Stability** — Intact vials of omeprazole infusion and injection should be stored at room temperature not exceeding 25 °C and protected from light. Discoloration of the reconstituted solution may occur if reconstituted incorrectly. Dilution of omeprazole infusion with sodium chloride 0.9% results in a solution that is stable for 12 hours <sup>(38) (115)</sup>; diluted in dextrose 5% omeprazole is stable for three <sup>(38)</sup> to six <sup>(115)</sup> hours. Other solutions must not be used for dilution of omeprazole infusion. Omeprazole injection reconstituted with the accompanying special diluent is stable for four hours. Do not use the reconstituted solution if particles are present. <sup>(38) (115)</sup>

Reconstituted omeprazole has been reported to develop an unacceptable discoloration indicating decomposition within six hours at room temperature exposed to light. <sup>(2507)</sup>

### Compatibility Information

#### Solution Compatibility

##### Omeprazole

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	BA	PH	400 mg	Physically compatible. 10% loss occurs in 2.5 days at 22 °C in light	2696	C
Sodium chloride 0.9%	BA	PH	400 mg	Physically compatible. 10% loss occurs in 10 days at 22 °C in light	2696	C

#### Y-Site Injection Compatibility (1:1 Mixture)

##### Omeprazole

## Ondansetron Hydrochloride - AHFS 56:22.20

**Products** — Ondansetron hydrochloride is available in 20-mL multiple-dose vials and 2-mL single-dose vials.<sup>(2836) (2837)</sup> Each milliliter of solution in multiple-dose vials contains ondansetron (as the hydrochloride dihydrate) 2 mg with sodium chloride 8.3 mg, citric acid monohydrate 0.5 mg, sodium citrate dihydrate 0.25 mg, methylparaben 1.2 mg, and propylparaben 0.15 mg in water for injection.<sup>(2836) (2837)</sup> Each milliliter of solution in single-dose vials contains ondansetron (as the hydrochloride dihydrate) 2 mg with sodium chloride 9 mg, citric acid monohydrate 0.5 mg, and sodium citrate dihydrate 0.25 mg in water for injection.<sup>(2836)</sup>

*pH* — From 3.3 to 4.<sup>(2836)</sup>

*Trade Name(s)* — Zofran

**Administration** — Ondansetron hydrochloride is administered by intravenous infusion over 15 minutes after further dilution with 50 mL of sodium chloride 0.9% or dextrose 5%.<sup>(2836) (2837)</sup> By intravenous injection, it is administered undiluted over at least 30 seconds and preferably over two to five minutes.<sup>(2836) (2837)</sup>

Ondansetron hydrochloride also has been administered intramuscularly *without* dilution.<sup>(2836) (2837)</sup>

**Stability** — Ondansetron hydrochloride is a clear, colorless solution.<sup>(2836) (2837)</sup> It should be stored at 2 to 30°C and protected from light.<sup>(2836) (2837)</sup> Although ondansetron hydrochloride is unstable under intense light, it is stable for about a month in daylight with added fluorescent light.<sup>(1366)</sup> Ondansetron occasionally may precipitate at the stopper/vial interface in vials that are stored upright; the potency and safety of ondansetron are not affected.<sup>(2836) (2837)</sup> If a precipitate is observed, the drug may be resolubilized by vigorously shaking the vial.<sup>(2836) (2837)</sup>

Ondansetron hydrochloride (Glaxo) 0.03 and 0.3 mg/mL in dextrose 5% or sodium chloride 0.9% was stable when frozen at -20 °C, exhibiting a 10% or less loss in three months.<sup>(1642)</sup>

*pH Effects* — The natural pH of ondansetron hydrochloride solutions is about 4.5 to 4.6.<sup>(1366) (1367)</sup> The pH of commercially available ondansetron solution has been adjusted with citric acid monohydrate and sodium citrate dihydrate to the range of 3.3 to 4.<sup>(2836) (2837)</sup> If the pH is increased, a precipitate of ondansetron free base has been reported to develop at pH 5.7<sup>(1366)</sup> and pH 7.<sup>(1513)</sup> Redissolution of the ondansetron precipitate occurs at pH 6.2 when titrated with hydrochloric acid.<sup>(1513)</sup> Precipitation by combination with alkaline drugs has been observed.<sup>(1365) (1513)</sup>

*Syringes* — The stability of ondansetron hydrochloride undiluted at 2 mg/mL and diluted in dextrose 5% and sodium chloride 0.9% at 1, 0.5, and 0.25 mg/mL packaged in polypropylene syringes was reported. Representative syringes were stored at 24 °C for 48 hours, 4 °C for 14 days, and frozen at -20 °C for 90 days. Visually, the solutions exhibited no precipitate or color or clarity changes. Ondansetron hydrochloride concentrations in all samples remained above 90%; most samples were above 95%. Sequentially storing sample syringes for 90 days at -20 °C followed by 14 days at 4 °C followed by 48 hours at 24 °C did not alter the stability.<sup>(2056)</sup>

When diluted with compatible infusion solutions, ondansetron hydrochloride is stable for up to seven days at room temperature or under refrigeration in Plastipak syringes with syringe caps.<sup>(1366)</sup>

*Filtration* — Ondansetron hydrochloride (Glaxo) 0.03 and 0.2 mg/mL (30 and 200 mcg/mL) in sodium chloride 0.9% was delivered over 15 minutes through five 0.2- $\mu$ m inline filters: Continu-Flo Solution Set (Baxter, 2C5561S), Filtered Extension Sets (Burrn, PFE-2007 and FE-2024), Universal

Primary infusion set (IVAC, 52023), and Ivex-HP Filterset-SL (Abbott, 4524). Little or no ondansetron loss was found. <sup>(1678)</sup>

*Central Venous Catheter* — Ondansetron hydrochloride (Glaxo Wellcome) 0.2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

Methylprednisolone sodium succinate	PH	2.4 g	GSK	160 mg	D5W, NS	Transient turbidity forms then clears. 5% or less loss of either drug in 24 hr at 23 °C and 48 hr at 6 °C	<a href="#">2643</a>	?
Morphine sulfate	AST	1 g	GL	100 mg and 1 g	NS	Physically compatible. No ondansetron loss and 5% or less morphine loss in 7 days at 32 °C or 31 days at 4 and 22 °C protected from light	<a href="#">1690</a>	C
Ranitidine HCl with fluconazole	RR	2 g	GL	100 mg	<sup>a</sup>	Visually compatible with no loss of any drug in 4 hr	<a href="#">1730</a>	C
Tramadol HCl	GRU	400 mg	GL	1.6 mg	NS	Visually compatible with about 7% tramadol loss in 24 hr at room temperature	<a href="#">2652</a>	C
Vincristine sulfate with doxorubicin HCl	LI AD	14 mg 400 mg	GL	480 mg	D5W <sup>b</sup>	Visually compatible. Under 10% loss of all drugs in 5 days at 4 °C then 24 hr at 30 °C	<a href="#">2092</a>	C
Vincristine sulfate with doxorubicin HCl	AD LI	28 mg 800 mg	GL	960 mg	D5W <sup>a</sup>	Visually compatible. Under 10% loss of all drugs after 120 hr at 30 °C	<a href="#">2092</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polyisoprene reservoirs (Travenol Infusors).

<sup>c</sup>Tested in ondansetron hydrochloride ready-to-use CR3 polyester bags.

<sup>d</sup>Tested in polyolefin containers.**Drugs in Syringe Compatibility****Ondansetron HCl**

<b>Drug (in syringe)</b>	<b>Mfr</b>	<b>Amt</b>	<b>Mfr</b>	<b>Amt</b>	<b>Remarks</b>	<b>Ref</b>	<b>C/I</b>
Alfentanil HCl	JN	0.167 mg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Little loss of either drug in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Atropine sulfate	GNS	0.133 mg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Under 6% ondansetron and under 7% atropine losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Dexamethasone sodium phosphate	ES	0.33 and 0.67 mg/mL <sup>a</sup>	CER	0.17 mg/mL <sup>a</sup>	Visually compatible. No loss of either drug in 30 days at 4 °C then 2 days at 23 °C	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	0.5 mg/mL <sup>a</sup>	CER	0.25 mg/mL <sup>a</sup>	Visually compatible. No loss of either drug in 30 days at 4 °C then 2 days at 23 °C	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	1 mg/mL <sup>a</sup>	CER	0.25 mg/mL <sup>a</sup>	Visually compatible for 3 days at 4 °C. Precipitation of ondansetron observed at 7 days as opaque white ring	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	0.33 and 0.67 mg/mL <sup>a</sup>	CER	0.33 mg/mL <sup>a</sup>	Visually compatible. No loss of either drug in 30 days at 4 °C then 2 days at 23 °C	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	0.5 mg/mL <sup>a</sup>	CER	0.5 mg/mL <sup>a</sup>	Visually compatible. No loss of either drug in 30 days at 4 °C then 2 days at 23 °C	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	1 mg/mL <sup>a</sup>	CER	0.5 mg/mL <sup>a</sup>	Visually compatible for 3 days at 4 °C. Precipitation of ondansetron observed at 5 days as opaque white ring	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	0.33 and 0.67 mg/mL <sup>a</sup>	CER	0.67 mg/mL <sup>a</sup>	Visually compatible. No loss of either drug in 30 days at 4 °C then 2 days at 23 °C	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	0.33 mg/mL <sup>a</sup>	CER	1.07 mg/mL <sup>a</sup>	Visually compatible. No loss of either drug in 30 days at 4 °C then 2 days at 23 °C	<a href="#">1882</a>	C
Dexamethasone sodium phosphate	ES	0.67 mg/mL <sup>a</sup>	CER	1.07 mg/mL <sup>a</sup>	Heavy white precipitate in 72 hr at 4 °C. 25 to 30% loss of both drugs	<a href="#">1882</a>	I
Dexamethasone sodium phosphate	OM <sup>c</sup>	4 mg/1 mL		4 mg/2 mL	Physically incompatible within 3 min	<a href="#">2767</a>	I

Dexamethasone sodium phosphate	<sup>d</sup>	4 mg/1 mL		4 mg/2 mL	Physically compatible	<a href="#">2767</a>	C
Droperidol	AMR	1.25 mg/mL <sup>b</sup>	GW	1 mg/mL <sup>b</sup>	Droperidol precipitates at 4 °C. At 23 °C, little or no loss of either drug in 8 hr, but droperidol precipitates after that time	<a href="#">2199</a>	I
Fentanyl citrate	ES	16.7 mcg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Little loss of either drug in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Glycopyrrolate	AMR	0.1 mg/mL <sup>b</sup>	GW	1 mg/mL <sup>b</sup>	Physically compatible. Little loss of either drug in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Meperidine HCl	ES	8.33 mg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Little loss of either drug in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Metoclopramide HCl	SO	2.5 mg/mL <sup>b</sup>	GW	1 mg/mL <sup>b</sup>	Physically compatible. Under 6% ondansetron and under 5% metoclopramide losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Midazolam HCl	RC	1.66 mg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Under 4% ondansetron and under 7% midazolam losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Morphine sulfate	ES	2.67 mg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Under 5% ondansetron and under 4% morphine losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Naloxone HCl	AST	0.133 mg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Under 6% ondansetron and under 5% naloxone losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Neostigmine methylsulfate	ES	0.167 mg/mL <sup>b</sup>	GW	1.33 mg/mL <sup>b</sup>	Physically compatible. Under 3% ondansetron and under 5% neostigmine losses in 24 hr at 4 or 23 °C	<a href="#">2199</a>	C
Propofol	STU	1 and 5 mg/mL <sup>b</sup>	GW	1 mg/mL <sup>b</sup>	Physically compatible. Little loss of either drug in 4 hr at 23 °C	<a href="#">2199</a>	C

<sup>a</sup>Diluted with sodium chloride 0.9% drawn into a syringe prior to drugs to yield the concentrations cited.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Contained benzyl alcohol as a preservative.

<sup>d</sup>Contained parabens as preservatives.

### **Y-Site Injection Compatibility (1:1 Mixture)**

**Ondansetron HCl**

<b>Drug</b>	<b>Mfr</b>	<b>Conc</b>	<b>Mfr</b>	<b>Conc</b>	<b>Remarks</b>	<b>Ref</b>	<b>C/I</b>
Acetaminophen	CAD	10 mg/mL	WW	2 mg/mL	Physically compatible with less than 10% acetaminophen loss over 4 hr at room temperature	<a href="#">2841</a> <a href="#">2844</a>	C
Acyclovir sodium	BW	7 mg/mL <sup>a</sup>	GL	1 mg/mL <sup>b</sup>	Precipitates immediately	<a href="#">1365</a>	I
Aldesleukin	CHI	33,800 I.U./mL <sup>a</sup>	GL	0.7 mg/mL <sup>a</sup>	Visually compatible with little or no loss of aldesleukin activity	<a href="#">1857</a>	C
Aldesleukin	CHI	5 to 40 mcg/mL <sup>k</sup>	GL		Visually compatible. Aldesleukin activity retained if each drug infused at a similar rate. Ondansetron not tested	<a href="#">1890</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in sterile water for injection.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Tested in dextrose 5% with potassium chloride 0.02 mM/mL.

<sup>f</sup>Lyophilized formulation tested.

<sup>g</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>i</sup>Tested in Ringer's injection, lactated.

<sup>j</sup>Injected via Y-site into an administration set running azithromycin.

<sup>k</sup>Tested with albumin human 0.1%.

<sup>l</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>m</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

Ondansetron Hydrochloride - AHFS 56:22.20

## Oxacillin Sodium - AHFS 8:12.16.12

**Products** — Oxacillin sodium is available in vials containing the equivalent of oxacillin 1 and 2 g. A 10-g hospital bulk package also is available. The products contain dibasic sodium phosphate 20 mg/g of drug.<sup>(4)</sup>

For intramuscular use, reconstitute the 1-g vials with 5.7 mL and the 2-g vials with 11.5 mL of sterile water for injection or sodium chloride 0.45 or 0.9% and shake until a clear solution is obtained. A 250-mg/1.5 mL (167 mg/mL) solution results.<sup>(4)</sup>

For direct intravenous injection, reconstitute the 1- or 2-g vials with 10 or 20 mL, respectively, of sterile water for injection, sodium chloride 0.45%, or sodium chloride 0.9% and shake until a clear solution is obtained to yield a 100-mg/mL concentration.<sup>(4)</sup>

The 10-g hospital bulk package is reconstituted with 93 mL of sterile water for injection to yield a 100-mg/mL solution.<sup>(4)</sup>

Frozen premixed solutions of oxacillin 1 g/50 mL in dextrose 3% and 2 g/50 mL in dextrose 0.6% are also available. The solutions also contain sodium citrate buffer and hydrochloric acid and/or sodium hydroxide to adjust the pH.<sup>(1-2/07)</sup> (4)

*pH* — From 6 to 8.5.<sup>(17)</sup> At 10 g/L in dextrose 5%, the pH has been variously reported as 7.4<sup>(149)</sup> and 7.94.<sup>(153)</sup> At this concentration in sodium chloride 0.9%, the pH has been reported as 7.73.<sup>(153)</sup>

*Osmolality* — The osmolality of oxacillin sodium 250 mg/1.5 mL in sterile water for injection was 596 mOsm/kg by freezing-point depression and 657 mOsm/kg by vapor pressure.<sup>(1071)</sup>

The osmolality of oxacillin sodium 50 mg/mL was 381 mOsm/kg in dextrose 5% and 396 mOsm/kg in sodium chloride 0.9%.<sup>(1375)</sup>

The osmolality of oxacillin sodium was calculated for the following dilutions<sup>(1054)</sup> :

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>1 g</b>		
Dextrose 5%	326	295
Sodium chloride 0.9%	353	321
<b>2 g</b>		
Dextrose 5%	379	329
Sodium chloride 0.9%	406	356

The following maximum oxacillin sodium concentrations have been recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients<sup>(1180)</sup> :

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	59	530
Sodium chloride 0.9%	53	519
Sterile water for injection	106	422

The frozen premixed solutions are iso-osmotic, having an osmolality of about 300 mOsm/kg.<sup>(4)</sup>

**Sodium Content** — Each gram of oxacillin sodium powder contains approximately 2.5 to 3.1 mEq of sodium.<sup>(4)</sup>

**Administration** — Oxacillin sodium may be administered by deep intramuscular injection, direct intravenous injection, or by continuous or intermittent intravenous infusion. By direct intravenous injection, the dose should be given over a 10-minute period. To minimize vein irritation, intravenous injections should be made as slowly as possible. For intermittent infusion, the drug should be further diluted with a compatible solution to a concentration of 0.5 to 40 mg/mL.<sup>(4)</sup>

**Stability** — Oxacillin sodium in intact vials should be stored at controlled room temperature. After reconstitution, oxacillin sodium is stable for three days at room temperature and for one week under refrigeration at concentrations used for intramuscular or direct intravenous injection. The reconstituted hospital bulk package is stable for 24 hours at room temperature.<sup>(4)</sup>

The frozen premixed injection is stable at -20 °C for at least 90 days after shipping. The frozen premixed infusions should be thawed at room temperature or under refrigeration and should not be refrozen after being thawed. The thawed solutions are stated to be stable for 48 hours at room temperature and 21 days under refrigeration.<sup>(4)</sup>

**Freezing Solutions** — Oxacillin sodium, 500 mg/2.5 mL and 1 g/5 mL in sterile water for injection in glass and plastic syringes and 200 mg/mL in the original vial, was frozen at -20 °C. Adequate stability was maintained over three months.<sup>(303)</sup>

In another study, oxacillin sodium 1 g/100 mL of dextrose 5% in PVC bags was frozen at -20 °C for 30 days. The bags were then thawed by exposure to ambient temperature or microwave radiation. The solutions had no precipitation or color change and no drug loss. Subsequent storage at room temperature for 24 hours yielded a physically compatible solution, which exhibited a 3 to 4% loss.<sup>(554)</sup>

**Syringes** — Oxacillin sodium (Bristol) 8.33, 16.7, and 33.3 mg/mL in dextrose 5% and in sodium chloride 0.9% packaged in plastic syringes was reported to be stable for 24 hours at room temperature, 8 days refrigerated, and 30 days frozen at -20 °C.<sup>(31)</sup>

**Ambulatory Pumps** — The stability of oxacillin sodium 120 mg/mL in sterile water for injection was evaluated in PVC portable infusion pump reservoirs (Pharmacia Deltec). No oxacillin loss in three days at 25 °C and 5% loss in 14 days at 5 °C was found.<sup>(2080)</sup>

**Sorption** — Little loss due to sorption of oxacillin sodium (Bristol) 1 g/100 mL in dextrose 5% and sodium chloride 0.9% in trilayer solution bags (Bieffe Medital) composed of polyethylene, polyamide, and polypropylene occurred in two hours. Similarly, no loss was found during a one-hour simulated infusion.<sup>(1918)</sup>

## Compatibility Information

### Solution Compatibility

#### Oxacillin sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Amino acids 4.25%, dextrose 25%	MG	BR	500 mg	No increase in particulate matter in 24 hr at 5 °C	<a href="#">349</a>	C

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>e</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>f</sup>A 32.5-mL sample of parenteral nutrition solution mixed with 50 mL of antibiotic solution.

<sup>g</sup>Run at 21 mL/hr.

<sup>h</sup>Given over five minutes by syringe pump.

<sup>i</sup>Run at 94 mL/hr.

---

Oxacillin Sodium - AHFS 8:12.16.12

## Oxaliplatin - AHFS 10:00

**Products** — Oxaliplatin is available as a 5-mg/mL concentrated solution in 10-, 20-, and 40-mL single-use vials. [\(2852\)](#) [\(2853\)](#)

Oxaliplatin is also available in single-use vials containing 50 or 100 mg of lyophilized drug and lactose monohydrate as an excipient. [\(2854\)](#) Reconstitute the 50- or 100-mg vials with 10 or 20 mL, respectively, of water for injection or dextrose 5%. [\(2854\)](#)

*Trade Name(s)* — Eloxatin

**Administration** — For intravenous infusion, both the concentrated injection and the reconstituted solution must be diluted in 250 to 500 mL of dextrose 5% prior to administration. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#) Chloride-containing solutions must not be used for reconstitution [\(2854\)](#) or dilution. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#)

Oxaliplatin is administered by intravenous infusion over 2 hours. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#)

Contact of oxaliplatin solutions with aluminum in needles or metal parts of administration equipment should be avoided. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#) Aluminum has caused degradation of some platinum compounds. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#)

**Stability** — Intact vials of both formulations are stored at controlled room temperature. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#) Protect vials of the concentrated solution from light by storing in the outer carton, and do not freeze. [\(2852\)](#) [\(2853\)](#) Vials of the lyophilized formulation and solutions diluted for infusion do not require light protection. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#)

Following reconstitution of the lyophilized oxaliplatin formulation in the original vial, the resulting solution may be stored up to 24 hours under refrigeration. [\(2854\)](#)

After final dilution of either formulation for administration in 250 to 500 mL of dextrose 5%, the manufacturers indicate that the drug is stable for six hours at room temperature or for 24 hours under refrigeration. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#) However, Sanofi stated that oxaliplatin diluted in dextrose 5% for infusion was stable for 24 hours at room temperature; at a concentration of 3 g/L, the drug was stated to be stable for at least five days at room temperature. [\(2623\)](#)

*pH Effects* — Oxaliplatin is incompatible with alkaline drugs and solutions and should not be mixed with or administered simultaneously with them. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#) Administration lines should be flushed with dextrose 5% prior to administering any other medication. [\(2852\)](#) [\(2853\)](#) [\(2854\)](#)

## Oxycodone Hydrochloride - AHFS 28:08.08

**Products** — Oxycodone hydrochloride is available as a 10-mg/mL injection (equivalent to 9 mg of oxycodone base per milliliter) in 1- and 2-mL ampuls. Also present in the formulation are citric acid monohydrate, sodium citrate, sodium chloride, and hydrochloric acid and/or sodium hydroxide to adjust pH in water for injection. <sup>(38)</sup>

**Administration** — Oxycodone hydrochloride is administered by subcutaneous or intravenous injection or infusion. For infusion, the drug may be diluted to a concentration of 1 mg/mL in dextrose 5% or sodium chloride 0.9%. <sup>(38)</sup>

**Stability** — Intact vials should be stored at controlled room temperature. The ampuls should be used immediately upon opening; unused portions should be discarded immediately. The manufacturer states that oxycodone hydrochloride diluted for infusion is stable for 24 hours under refrigeration. <sup>(38)</sup>

Oxycodone Hydrochloride - AHFS 28:08.08

## Oxytocin - AHFS 76:00

**Products** — Oxytocin is available in 1-mL single-use vials and 10-, 30-, and 50-mL multiple-dose vials.<sup>(2856) (2857) (2858)</sup> Each milliliter contains oxytocin 10 units with chlorobutanol 0.5%.<sup>(2856) (2857) (2858)</sup> Acetic acid may have been added to adjust the pH during manufacture.<sup>(4) (2856) (2857) (2858)</sup>

**Units** — One unit of oxytocin is equivalent to 2 to 2.2 mcg of pure oxytocin.<sup>(4)</sup>

**pH** — The pH range is 3 to 5.<sup>(17) (2858)</sup>

**Trade Name(s)** — Pitocin

**Administration** — Oxytocin is administered by intravenous infusion using an infusion control device;<sup>(4)</sup> the drug may also be administered by intramuscular injection,<sup>(2856) (2857) (2858)</sup> although intramuscular injection is usually not recommended for induction or augmentation of labor because the drug's effects are unpredictable and difficult to control.<sup>(4)</sup>

For intravenous administration, the injection should be diluted to a usual concentration of 10 milliunits/mL by adding 10 units (1 mL) to 1000 mL of Ringer's injection, lactated, or sodium chloride 0.9%.<sup>(4) (2856) (2857) (2858)</sup> A higher concentration range of 10 to 40 milliunits/mL in sodium chloride 0.9% or dextrose 5% has been cited for select indications.<sup>(2856) (2857) (2858)</sup>

**Stability** — Oxytocin injection should be stored at controlled room temperature<sup>(2856) (2857) (2858)</sup> and protected from freezing.<sup>(2858)</sup> Do not use the solution if it is discolored or contains a precipitate.<sup>(4) (2856) (2857) (2858)</sup> Discard unused portions of the drug.<sup>(2857) (2858)</sup>

Oxytocin appears to be rapidly decomposed in the presence of sodium bisulfite.<sup>(333)</sup>

**Filtration** — Oxytocin (Parke-Davis) 25 units/100 mL in dextrose 5% and sodium chloride 0.9% was filtered at about 3 mL/min through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2). At this concentration, 25 times higher than normally used, oxytocin appeared to bind initially to the filter from the sodium chloride 0.9% solution. Results in dextrose 5% were equivocal. From these data, it is not possible to draw a definite conclusion regarding substantial binding of oxytocin during normal usage.<sup>(533)</sup>

### Compatibility Information

## Paclitaxel - AHFS 10:00

**Products** — Paclitaxel is available as 6-mg/mL non-aqueous concentrated solution that must be diluted for use and is available in 5-, 16.7-, 25-, and 50-mL multiple-dose vials. One milliliter provides paclitaxel 6 mg with polyoxyl 35 castor oil (Cremophor EL; polyoxyethylated castor oil) surfactant 527 mg and dehydrated alcohol 49.7% (v/v). Some formulations also incorporate citric acid anhydrous 2 mg/mL.<sup>(1-8/08) (4)</sup>

**CAUTION:** Care should be taken to ensure that the correct drug product, dose, and administration procedure are used and that no confusion with other products occurs.

Although Abraxane, a protein-bound paclitaxel suspension<sup>(1-8/08)</sup>, exists it is sufficiently different from conventional solvent-formulated paclitaxel that extrapolating information to or from it would be inappropriate.

**pH** — Paclitaxel admixtures at concentrations of 0.6 and 1.2 mg/mL in dextrose 5%, sodium chloride 0.9%, and dextrose 5% in lactated Ringer's injection have a pH of 4.4 to 5.6.<sup>(4)</sup>

**Trade Name(s)** — Onxol, Taxol

**Administration** — Paclitaxel is administered by intravenous infusion. The concentrate must be diluted to a final paclitaxel concentration of 0.3 to 1.2 mg/mL in dextrose 5%, sodium chloride 0.9%, dextrose 5% in sodium chloride 0.9%, or dextrose 5% in lactated Ringer's injection. Administration over three hours is often recommended<sup>(1-8/08) (4)</sup>, although other duration periods have been used.<sup>(4)</sup> An inline 0.22- $\mu$ m filter should be used for administration. The intravenous solution containers and administration sets should be free of the plasticizer diethylhexyl phthalate (DEHP).<sup>(1-8/08)</sup>

Use of self-venting sets spiked into glass bottles of paclitaxel admixtures has occasionally resulted in solution dripping from the air vent. Presumably, the surfactant content wetted the hydrophobic filter, allowing the solution to drip.<sup>(1843)</sup> In another observation, the spikes of administration sets were made sufficiently slippery by surfactant in the paclitaxel formulation that the spike slipped out after it had been seated through the rubber bung of the glass bottle. The admixture also leaked due to a poor seal. The authors recommend use of non-PVC plastic solution containers to avoid the problem.<sup>(2052)</sup>

**Stability** — Intact vials should be stored between 20 and 25 °C and protected from light. Stability is not adversely affected by refrigeration or freezing. Refrigeration may result in the precipitation of formulation components. However, warming to room temperature redissolves the material and does not adversely affect the product. If a precipitate is insoluble, the product should be discarded.<sup>(1-8/08)</sup>

Paclitaxel 0.7 mg/mL diluted in sodium chloride 0.9% did not exhibit an antimicrobial effect on the growth of three of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. *S. aureus* remained viable for 4 hours. *E. faecium* and *P. aeruginosa* remained viable for 48 hours, and *C. albicans* remained viable to the end of the study at 120 hours. Diluted solutions of paclitaxel should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>(2160)</sup>

**Turbidity** — Paclitaxel is a clear, colorless to slightly yellow viscous liquid. After dilution in an infusion solution, the drug may exhibit haziness because of the surfactant content of the formulation.<sup>(1528)</sup>

**Precipitation** — Although paclitaxel in aqueous solutions is chemically stable for 27 hours<sup>(1-8/08)</sup> or longer<sup>(1746) (1842) (2708)</sup>, precipitation has occurred irregularly and unpredictably. Such precipitation

occurs within the recommended range of 0.3 to 1.2 mg/mL and at lower paclitaxel concentrations. These precipitates have been observed in the infusion tubing distal to the pump chamber.<sup>(1716)</sup> Although precipitation of insoluble drugs in an aqueous medium is a foregone conclusion, the time to precipitation is irregular. It may be accelerated by the presence or formation of crystallization nuclei, agitation, and contact with incompatible drugs or materials.<sup>(1374) (1521)</sup> Since the mechanism of this irregular precipitation has not been identified<sup>(1739)</sup>, vigilance throughout its infusion is required.

*Sorption* — No paclitaxel loss due to sorption to containers or sets has been observed.<sup>(1520) (2230) (2231) (2232)</sup>

*Plasticizer Leaching* — Contact of undiluted paclitaxel concentrate with plasticized PVC equipment and devices is not recommended.<sup>(1-8/08) (4)</sup> With use of infusion bags and tubing that are free of DEHP plasticizer and the elimination of PVC precision flow regulators, a reduction in leached DEHP of up to 96% has been reported.<sup>(2679)</sup>

Paclitaxel vehicle equivalent to paclitaxel 1.2 mg/mL in dextrose 5% in VISIV polyolefin bags was tested at room temperature near 23 °C for 24 hours. No plastic components leached within the 24-hour study period.<sup>(2660) (2792)</sup>

Paclitaxel itself does not contribute to the extraction of the plasticizer DEHP.<sup>(1520)</sup> However, the surfactant, Cremophor EL, in the paclitaxel formulation extracts DEHP from PVC containers and sets. The amount of DEHP extracted increases with time and drug concentration.<sup>(1520) (1683) (2146)</sup> Consequently, the use of DEHP-plasticized PVC containers and sets is not recommended for infusion of paclitaxel solutions. Instead, the manufacturer recommends the use of glass, polypropylene, or polyolefin containers and non-PVC administration sets such as those that are polyethylene lined.<sup>(1-8/08)</sup>

The use of inline filters, such as the Ivex-2 filter set that incorporates about 10 inches of PVC inlet and outlet tubing, has resulted in a small amount of DEHP extraction. Since the extracted DEHP is at a sufficiently low level, however, the manufacturer considers the Ivex-2 filter set to be acceptable.<sup>(1-8/08)</sup>

A study was performed on the compatibility of paclitaxel 0.3- and 1.2-mg/mL infusions with various non-PVC infusion sets. The paclitaxel infusions were run through the study sets, and the effluent was then analyzed for leached DEHP plasticizer. The following sets had significant and unacceptable amounts of leached DEHP: Baxter vented nitroglycerin (2C7552S), Baxter vented basic solution (1C8355S), McGaw Horizon pump vented nitroglycerin (V7450), and McGaw Intelligent pump vented nitroglycerin (V7150). Although these sets were largely non-PVC, their highly plasticized pumping segments contributed the DEHP. The administration and extension sets cited in Tables 1 and 2 exhibited no more leached DEHP than the Ivex-2 filter set specified in the product labeling.<sup>(1843)</sup>

**Table 1. Administration Sets Compatible with Paclitaxel Infusions by Manufacturer**<sup>1843</sup>

Abbott	LifeCare 5000 Plum PVC specialty set (11594)
	Life Shield anesthesia pump set OL with cartridge (13503)
	LifeCare model 4P specialty set, non-PVC (11434)
	Omni-Flow universal primary intravenous pump short minibore patient line (40527)
Baxter	Vented volumetric pump nitroglycerin set (2C1042)
Block Medical	Verifuse nonvented administration set with 0.22- $\mu$ m filter, check valve, injection site, and non-DEHP PVC tubing (V021015)
I-Flow	Vivus-4000 polyethylene-lined infusion set (5000-784)
IMED	Standard PVC set (9215)
	Closed-system non-PVC fluid path nonvented quick-spike administration set (9635)
	Non-PVC set with inline filter (9986)
	Gemini 20 nonvented primary administration set for nitroglycerin and emulsions (2262)

IVAC	Universal set with low-sorbing tubing (52053, 59953, and S75053)
Ivion/Medex	WalkMed spike set (SP-06) with pump set (PS-401, PS-360, FPS-560, or FPX-560)
Siemens	Reduced-PVC full set MiniMed Uni-Set macrobore (28-60-190)

**Table 2. Extension Sets Compatible with Paclitaxel Infusions by Manufacturer**<sup>1843</sup>

Abbott	Ivex-HP filter set (4524) Ivex-2 filter set (2679)
Becton-Dickinson	Intima intravenous catheter placement set (38-6918-1) J-loop connector (38-1252-2) E-Z infusion set shorty (38-53741) E-Z infusion set (38-53121)
Baxter	Polyethylene-lined extension set with 0.22- $\mu$ m air-eliminating filter (1C8363)
Braun	0.2- $\mu$ m filter extension set (FE-2012L) Small-bore 0.2- $\mu$ m filter extension set (PFE-2007) Whin-winged extension set with 90° Huber needle (HW-2267) Whin extension set with Y-site and Huber needle (HW-2276 YHR) Y-extension set with valve (ET-08-YL) Small-bore extension set with T-fitting (ET-04T) Small-bore extension set with reflux valve (ET-116L)
Gish Biomedical	VasTack noncoring portal-access needle system (VT-2022)
IMED	0.2- $\mu$ m add-on filter set (9400 XL)
IVAC	Spec-Sets extension set with 0.22- $\mu$ m inline filter (C20028 and C20350)
Ivion/Medex	Extension set with 0.22- $\mu$ m filter (IV4A07-IV3)
PALL	SetSaver extended-life disposable set with 0.2- $\mu$ m filter (ELD-96P and ELD-96LL) SetSaver extended-life disposable microbore extension tubing with 0.2- $\mu$ m Posidyne filter (ELD-96LYL and ELD-96LYLN)
Pfizer/Strato Medical	Lifeport vascular-access system infusion set with Y-site (LPS 3009)

Paclitaxel 0.3 and 1.2 mg/mL was prepared in PVC bags dextrose 5% and in sodium chloride 0.9%. Leaching of the plasticizer was found to be time and concentration dependent; however, there was little difference between the two infusion solutions. After storage for eight hours at 21 °C, leached DEHP in the range from 73 to 108 mcg/mL was found for the 1.2 mg/mL concentration and from 21 to 30 mcg/mL for the 0.3 mg/mL concentration. During a simulated one-hour infusion using DEHP plasticized administration sets, the amount of leached DEHP did not exceed 18 mcg/mL at the 0.3 mg/mL paclitaxel concentration but resulted in a maximum of 114 mcg/mL with the 1.2 mg/mL concentration.<sup>(1825)</sup>

DEHP plasticizer leaching from PVC containers and administration sets, and the amount of DEHP leached was reported to depend on surfactant concentration and length of contact period. They also reported leaching of up to 30 mg of DEHP per dose from Flo-Gard Low Adsorption Sets (Baxter), a set with a reduced amount of PVC present in its construction.<sup>(2146)</sup>

An acceptability limit of no more than 5 parts per million (5 mcg/mL) for DEHP plasticizer released from PVC containers, administration sets, and other equipment has been proposed. The limit was based on a review of metabolic and toxicologic considerations.<sup>(2185)</sup>

Two reduced-phthalate administration sets for the Acclaim (Abbott) pump were evaluated. Administration set model 11993-48 (Abbott) is composed of polyethylene tubing but has a DEHP-plasticized pumping segment. Administration set model L-12060 (Abbott) is composed of tris(2-ethylhexyl)trimellitate (TOTM)-plasticized PVC tubing and a DEHP-plasticized pumping segment. Paclitaxel diluent at concentrations equivalent to 0.3 and 1.2 mg/mL in dextrose 5% delivered rapidly over three hours at 23 °C did not leach detectable levels of TOTM from model

L-12060 or DEHP from either set. Similarly, slow delivery over four days of the 0.3-mg/mL concentration yielded detectable but not quantifiable amounts of plasticizer. However, slow delivery of the equivalent of 1.2 mg/mL over four days yielded large but variable amounts of DEHP from both sets; DEHP concentrations ranged from 30 to 150 mcg/mL. Consequently, these two reduced-phthalate sets are suitable for short-term delivery up to three hours of paclitaxel at concentrations up to 1.2 mg/mL. However, these sets should not be used for slow delivery of paclitaxel. [\(2198\)](#)

Paclitaxel vehicle equivalent to paclitaxel 0.3 and 1.2 mg/mL in dextrose 5% did not leach TOTM plasticizer from a TOTM-plasticized PVC set (SoloPak) during simulated three-hour administration. During extremely slow delivery at 5.2 mL/hr for four days, no detectable TOTM was found in the 0.3-mg/mL equivalent concentration, and only a barely detectable, unquantifiable amount of TOTM was found with the 1.2-mg/mL equivalent solution. [\(2232\)](#)

Paclitaxel 0.3 and 1.2 mg/mL in dextrose 5% or in sodium chloride 0.9% in ethylene vinyl acetate (EVA) containers was found to leach an unknown material stored at 25 and 32 °C for 24 hours. [\(2182\)](#)

*Filtration* — The manufacturer recommends the use of a 0.22-µm inline filter for paclitaxel administration. [\(1-8/08\)](#) No loss of paclitaxel due to filtration through 0.22-µm filters occurs. [\(1-8/08\)](#) [\(1520\)](#)

The acceptability of the 0.22-µm IV Express Filter Unit (Millipore) for the administration of paclitaxel was evaluated. Paclitaxel vehicle equivalent to paclitaxel 1.2 mg/mL (for plasticizer leaching) and paclitaxel 0.3 mg/mL (for sorption potential) in 500 mL of dextrose 5% in polyolefin containers was delivered through the filter units over a three-hour period at a rate of 167 mL/hr at about 23 °C to simulate paclitaxel administration. No leached plasticizer and no loss of paclitaxel due to sorption was found. [\(2231\)](#)

*Central Venous Catheter* — The acceptability of the Arrow-Howes triple-lumen, 7 French, 30-cm polyurethane central catheter (Arrow International) for the administration of paclitaxel was evaluated. Paclitaxel vehicle equivalent to paclitaxel 0.3 and 1.2 mg/mL (for catheter component leaching) and paclitaxel 0.3 mg/mL (for sorption potential) were prepared in polyolefin bags of dextrose 5%. The solutions were delivered through the polyurethane central venous catheters for periods of three hours and of 24 hours at 23 °C to simulate rapid and slow administration. No leached catheter components were found in the effluent solution and no loss of paclitaxel occurred. [\(2230\)](#)

## Compatibility Information

### Solution Compatibility

#### Paclitaxel

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	MG, TR <sup>a</sup>	NCI	0.3, 0.6, 0.9 g	Visually compatible. No loss in 12 hr at 22 °C	<a href="#">1520</a>	C

<sup>a</sup>Tested in both glass and PVC containers.

<sup>b</sup>Tested in polyolefin containers.

<sup>c</sup>Tested in glass, PVC, and polyolefin containers.

<sup>d</sup>Tested in Baxter ethylene vinyl acetate (EVA) containers.

<sup>e</sup>Tested in ECOFLAC low-density polyethylene plastic containers.

<sup>f</sup>Tested in polyolefin containers.

<sup>g</sup>Tested in glass containers.

### **Additive Compatibility**

#### **Paclitaxel**

<b>Drug</b>	<b>Mfr</b>	<b>Conc/L</b>	<b>Mfr</b>	<b>Conc/L</b>	<b>Test Soln</b>	<b>Remarks</b>	<b>Ref</b>	<b>C/I</b>
Carboplatin	BMS	2 g	BMS	300 mg and 1.2 g	NS	No paclitaxel loss but carboplatin losses of less than 2, 5, and 6 to 7% at 4, 24, and 32 °C, respectively, in 24 hr. Physically compatible for 24 hr but microparticles of paclitaxel form after 3 to 5 days	<a href="#">2094</a>	C

Carboplatin	BMS	2 g	BMS	300 mg and 1.2 g	D5W	No paclitaxel and carboplatin loss at 4, 24, and 32 °C in 24 hr. Physically compatible for 24 hr but microparticles of paclitaxel form after 3 to 5 days	<a href="#">2094</a>	C
Cisplatin	BMS	200 mg	BMS	300 mg	NS	No paclitaxel loss and cisplatin losses of 1, 4, and 5% at 4, 24, and 32 °C, respectively, in 24 hr. Physically compatible for 24 hr but microparticles of paclitaxel form after 3 to 5 days	<a href="#">2094</a>	C
Cisplatin	BMS	200 mg	BMS	1.2 g	NS	No paclitaxel loss but cisplatin losses of 10, 19, and 22% at 4, 24, and 32 °C, respectively, in 24 hr. Physically compatible for 24 hr but microparticles of paclitaxel form after 3 to 5 days	<a href="#">2094</a>	I
Doxorubicin HCl	PH	200 mg	BMS	300 mg	D5W, NS	Visually compatible for 1 day with microprecipitation in 3 to 5 days and gross precipitation in 7 days at 4, 23, and 32 °C in the dark. No paclitaxel and under 8% doxorubicin loss in 7 days	<a href="#">2247</a>	C
Doxorubicin HCl	PH	200 mg	BMS	1.2 g	D5W, NS	Visually compatible for 1 day with microprecipitation in 3 to 5 days and gross precipitation in 7 days at 4, 23, and 32 °C in the dark. No paclitaxel and less than 7% doxorubicin loss in 7 days	<a href="#">2247</a>	C

**Y-Site Injection Compatibility (1:1 Mixture)**

## Palonosetron Hydrochloride - AHFS 56:22.20

**Products** — Palonosetron hydrochloride is available in 5-mL (0.25-mg) single-use vials containing palonosetron base as the hydrochloride.<sup>(2870)</sup> Each 5-mL vial also contains mannitol 207.5 mg, disodium edetate, and citrate buffer in water for injection.<sup>(2870)</sup>

Palonosetron hydrochloride is also available in 1.5-mL (0.075-mg) single-use vials containing palonosetron base as the hydrochloride.<sup>(2870)</sup> Each 1.5-mL vial also contains mannitol 83 mg, disodium edetate, and citrate buffer in water for injection.<sup>(2870)</sup>

*pH* — From 4.5 to 5.5.<sup>(2870)</sup>

*Tonicity* — Palonosetron hydrochloride injection is isotonic.<sup>(2870)</sup>

*Trade Name(s)* — Aloxi

**Administration** — Palonosetron hydrochloride is administered intravenously; the 0.075-mg dose is administered over 10 seconds, and the 0.25-mg dose is administered over 30 seconds.<sup>(2870)</sup> The manufacturer recommends that the infusion line be flushed with sodium chloride 0.9% before and after palonosetron hydrochloride is administered.<sup>(2870)</sup>

**Stability** — Intact vials of palonosetron hydrochloride injection should be stored at controlled room temperature and should be protected from light and freezing.<sup>(2870)</sup>

Palonosetron Hydrochloride - AHFS 56:22.20

## Pamidronate Disodium - AHFS 92:24

**Products** — Pamidronate disodium is available as a concentrate for injection in 10-mL vials containing 30, 60, or 90 mg pamidronate disodium in 10 mL water for injection.<sup>(2846)</sup> <sup>(2847)</sup> Each milliliter of solution also contains mannitol 47, 40, or 37.5 mg, respectively, and phosphoric acid and/or sodium hydroxide to adjust the pH.<sup>(2846)</sup> <sup>(2847)</sup>

Pamidronate disodium is also available as a lyophilized powder in vials containing 30 or 90 mg of the drug.<sup>(2847)</sup> Reconstitute 30- or 90-mg vial with 10 mL sterile water for injection to yield solutions containing 3 or 9 mg/mL, respectively, of pamidronate disodium.<sup>(2847)</sup> Each milliliter of the resulting 3- or 9-mg/mL pamidronate disodium solution also contains mannitol 47 or 37.5 mg, respectively, and phosphoric acid for pH adjustment.<sup>(2847)</sup>

*pH* — The injection concentrate has a pH of 6 to 7.<sup>(2846)</sup> <sup>(2847)</sup>

The pH of the lyophilized product is adjusted to 6.5 prior to lyophilization.<sup>(2847)</sup> After reconstitution, the pH is 6 to 7.4.<sup>(2847)</sup>

**Administration** — Pamidronate disodium concentrate or reconstituted solution is administered by intravenous infusion over 2 to 24 hours after dilution in 250 to 1000 mL of a compatible diluent.<sup>(2846)</sup> <sup>(2847)</sup>

**Stability** — Intact vials of pamidronate disodium concentrate and lyophilized powder for injection should be stored at controlled room temperature.<sup>(2846)</sup> <sup>(2847)</sup>

After the lyophilized pamidronate disodium powder for injection has been reconstituted as directed, the manufacturer states that the drug may be stored under refrigeration for up to 24 hours.<sup>(2847)</sup>

Pamidronate Disodium - AHFS 92:24

## Pancuronium Bromide - AHFS 12:20.20

**Products** — Pancuronium bromide is available in 2- and 5-mL vials containing 2 mg/mL of drug.<sup>(2871)</sup> It is also available in 10-mL vials at a concentration of 1 mg/mL.<sup>(2871) (2872)</sup> Each milliliter (Hospira) also contains sodium acetate anhydrous 1.2 mg, benzyl alcohol 1%, and sodium chloride to adjust for isotonicity.<sup>(2872)</sup> Each milliliter (Teva) also contains sodium acetate anhydrous 2 mg, benzyl alcohol 1%, sodium chloride 4 mg for isotonicity, and water for injection.<sup>(2871)</sup> Acetic acid and/or sodium hydroxide is added to adjust the pH.<sup>(2871) (2872)</sup>

*pH* — The solution has been adjusted to pH 3.8 to 4.2 by the manufacturer.<sup>(2871) (2872)</sup>

*Osmolality* — The osmolality of pancuronium bromide (Organon) 1 mg/mL was determined to be 277 mOsm/kg by freezing-point depression and 273 mOsm/kg by vapor pressure.<sup>(1071)</sup>

The osmolality of pancuronium bromide 2 mg/mL was determined to be 338 mOsm/kg.<sup>(1233)</sup>

**Administration** — Pancuronium bromide is administered intravenously.<sup>(2871) (2872)</sup>

**Stability** — Pancuronium bromide should be stored under refrigeration at 2 to 8 °C.<sup>(2871) (2872)</sup> However, the manufacturer indicates that the drug is stable for six months at room temperature.<sup>(853) (1181) (1433) (2871) (2872)</sup>

*Sorption* — The manufacturer indicates that pancuronium bromide in compatible infusion solutions does not undergo sorption to glass or plastic containers during short-term storage over 48 hours.<sup>(2871) (2872)</sup> However, the drug may exhibit sorption to plastic containers with prolonged contact.<sup>(4)</sup>

Pancuronium Bromide - AHFS 12:20.20

## Pantoprazole Sodium - AHFS 56:28.36

**Products** — Pantoprazole sodium is available as a lyophilized powder in vials containing pantoprazole 40 mg as the sodium salt with edetate disodium 1 mg and sodium hydroxide to adjust pH during manufacturing. <sup>(2850)</sup>

Reconstitute the vials with 10 mL of sodium chloride 0.9% to a concentration of 4 mg/mL. <sup>(2850)</sup> For intravenous infusion, one vial of the reconstituted drug solution may be diluted further with 100 mL or two vials may be diluted with 80 mL of sodium chloride 0.9%, dextrose 5%, or Ringer's injection, lactated to yield concentrations of about 0.4 or 0.8 mg/mL, respectively. <sup>(2850)</sup>

*pH* — From 9 to 10.5. <sup>(2850)</sup>

*Trade Name(s)* — Protonix I.V.

**Administration** — Pantoprazole sodium injection reconstituted as directed to a concentration of 4 mg/mL may be administered by intravenous infusion over a period of at least 2 minutes. <sup>(2850)</sup> The reconstituted solution may also be diluted further in a compatible infusion solution to a concentration of about 0.4 or 0.8 mg/mL and administered by intravenous infusion over about 15 minutes. <sup>(2850)</sup>

**Stability** — Intact vials of pantoprazole sodium should be stored at controlled room temperature and should be protected from light during storage. <sup>(2850)</sup>

After reconstitution as directed, pantoprazole sodium injection may be stored for up to 6 hours at room temperature before further dilution or 24 hours at room temperature if administered without further dilution. <sup>(2850)</sup> The manufacturer notes that the reconstituted solution should not be frozen. <sup>(2850)</sup>

After dilution in a compatible infusion solution, the drug may be stored for up to 24 hours at room temperature from the time of initial reconstitution prior to use. <sup>(2850)</sup> Protection from light exposure is not required. <sup>(2850)</sup> Pantoprazole sodium admixtures prepared for infusion did not undergo discoloration over 24 hours at room temperature exposed to light. <sup>(2507)</sup> Over time periods of up to 28 days, however, solutions have been noted to develop a slight yellow shade that is more apparent in more highly concentrated solutions. <sup>(2851)</sup> This color change did not appear to be associated with decomposition of the drug. <sup>(2851)</sup>

*Syringes* — Reconstituted pantoprazole sodium (Wyeth) 4 mg/mL in sodium chloride 0.9% in polypropylene syringes (Terumo) has been found to be physically and chemically stable for at least 96 hours at room temperature of 24 °C exposed to light and when refrigerated at 4°C. <sup>(2656)</sup>

### Compatibility Information

#### Solution Compatibility

##### Pantoprazole sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	BA	PH <sup>a</sup>	400 mg	Physically compatible. 10% loss occurs in 4 days at 22 °C in light	2696	C
Dextrose 5%	BA	ALT <sup>b</sup>	160 mg	10% loss in 24 hr at 23 °C. 5% loss in 14 days and 11% in 21 days at 4 °C	2798	C
Dextrose 5%	BA	ALT <sup>b</sup>	800 mg	9% loss in 4 days at 23 °C. Little loss in 21 days at 4 °C	2798	C

Pantoprazole Sodium - AHFS 56:28.36

## Papaverine Hydrochloride - AHFS 24:12.92

**Products** — Papaverine hydrochloride is available in 2-mL single-dose ampuls and vials and 10-mL multiple-dose vials. Each milliliter of solution contains 30 mg of papaverine as the hydrochloride. (1-2/06) (4) The multiple-dose vials also contain edetate disodium 0.005%, chlorobutanol 0.5%, and sodium hydroxide to adjust the pH. (1-2/06) The single-dose containers are preservative free. (4)

*pH* — Not below 3. (17)

**Administration** — Papaverine hydrochloride may be administered by intramuscular or slow intravenous injection over one to two minutes. (1-2/06) (4)

**Stability** — Papaverine hydrochloride injection should be stored at controlled room temperature and protected from light, temperatures of 40 °C or higher, and from freezing. (1-2/06) (4) It should not be refrigerated because of a reduction in solubility with possible precipitation. (593) The solutions should be clear and colorless to pale yellow. (1-2/06) The yellow discoloration of papaverine hydrochloride injection does not appear to be related to drug decomposition. Analysis of a yellow injection found nearly 100% of the drug. Furthermore, yellow discoloration is not produced by intentional degradation from boiling with acid or base. (1996)

### Compatibility Information

#### Solution Compatibility

##### Papaverine HCl

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose-Ringer's injection combinations	AB		96 mg	Physically compatible	3	C
Dextrose-saline combinations	AB		96 mg	Physically compatible	3	C
Dextrose 2.5%	AB		96 mg	Physically compatible	3	C

Papaverine Hydrochloride - AHFS 24:12.92

## Pemetrexed Disodium - AHFS 10:00

**Products** — Pemetrexed disodium is available in vials containing pemetrexed 500 mg as the disodium salt. The vials also contain mannitol 500 mg with hydrochloric acid and/or sodium hydroxide to adjust pH during manufacturing. The vials should be reconstituted with 20 mL of sodium chloride 0.9% (without preservatives) and swirled gently to yield a 25-mg/mL solution. (1-10/08)

*pH* — From 6.6 to 7.8. (1-10/08)

*Trade Name(s)* — Alimta

**Administration** — Pemetrexed disodium reconstituted as directed must be diluted to 100 mL with additional sodium chloride 0.9% for administration by intravenous infusion over 10 minutes. (1-10/08)

**Stability** — Intact vials of pemetrexed disodium may be stored at controlled room temperature. The reconstituted solution is chemically and physically stable for up to 24 hours at ambient room temperature and lighting and also under refrigeration. Pemetrexed disodium diluted in sodium chloride 0.9% for intravenous infusion is also stable for 24 hours at ambient room temperature and lighting and under refrigeration. The drug is not sensitive to light. (1-10/08)

Pemetrexed disodium (Lilly) 9 mg/mL in sodium chloride 0.9% did not result in the loss of viability of *Pseudomonas aeruginosa* within 120 hours at room temperature of 22 °C. A slight antimicrobial effect against *Staphylococcus aureus* was reported after 120 hours at room temperature; this slight effect cannot be regarded as sufficient for patient protection from growth of this microorganism. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods. (2740)

Pemetrexed disodium (Lilly) 25 mg/mL reconstituted with sodium chloride 0.9% was reported to be stable for 48 hours at 23 °C exposed to or protected from light and for 31 days at 4 °C exhibiting little or no drug loss when packaged in polypropylene syringes (Becton Dickinson) with Red Cap tip seals (Burron). (2676)

**Freezing Solutions** — Pemetrexed disodium (Lilly) 2 to 20 mg/mL in dextrose 5% and also in sodium chloride 0.9% frozen at -20 °C in PVC bags developed substantial amounts of microparticulates, up to 30,000/mL, at all time points in the study up to 90 days. Especially concerning was the presence of hundreds of particles of 10 µm and larger, which may adversely impact patient safety. Although little loss of the drug occurred, the formation of such large quantities of microparticulates made the solutions unacceptable for use. The microparticulates that formed appeared to be related to the PVC containers because upon repeating the study in glass laboratory vessels few microparticulates appeared. (2693)

### Compatibility Information

#### Solution Compatibility

##### Pemetrexed disodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	BA <sup>a</sup>	LI	2, 10, 20 g	Physically compatible for 48 hr at 23 °C. At 4 °C, microprecipitation occurs after 24 hr. No loss in 48 hr at 23 °C and in 31 days at 4 °C	2689	C
Ringer's injection				Physically incompatible	1(10/08)	I
Ringer's injection, lactated				Physically incompatible	1(10/08)	I

Sodium chloride 0.9%		LI		Physically compatible and stable for 24 hr at room temperature and refrigerated	<a href="#">1(10/08)</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	LI	2, 10, 20 g	Physically compatible for 48 hr at 23 °C. At 4 °C, microprecipitation occurs after 24 hr. No loss in 48 hr at 23 °C and in 31 days at 4 °C	<a href="#">2689</a>	C
Sodium chloride 0.9%	MAC <sup>a</sup>	LI	5 g	About 5% loss in 28 days at 2 to 8 °C. No visible precipitation, but possible microprecipitation not evaluated	<a href="#">2733</a>	?

<sup>a</sup>Tested in PVC containers.

## Penicillin G Potassium (BENZYL PENICILLIN POTASSIUM) - AHFS 8:12.16.04

**Products** — Penicillin G potassium is available in vial sizes of 5 million and 20 million units.<sup>(1-2/08)</sup> The commercial products contain sodium citrate and citric acid as buffers. Depending on the route of administration, reconstitute the vials with sterile water for injection, dextrose 5%, or sodium chloride 0.9%. The recommended reconstitution volumes may vary slightly among manufacturers; the amount of diluent recommended by the manufacturer should be used for reconstitution. To reconstitute the product, loosen the powder in the vials. While holding the vial horizontally, rotate it and add the diluent slowly, directing the stream against the wall of the vial. Shake the vial vigorously. When the required volume of solvent is greater than the capacity of the vial, a portion of the total volume of diluent may be added to the vial first to dissolve the drug. The resulting solution should then be withdrawn and mixed with the remainder of the needed diluent in a larger container.<sup>(1-2/08)</sup> (4)

Penicillin G potassium is also available as frozen premixed infusion solutions of 1, 2, and 3 million units in 50 mL of dextrose 4, 2.3, and 0.7%, respectively. The products also contain sodium citrate buffer; hydrochloric acid and/or sodium hydroxide may have been used to adjust the pH during manufacture.<sup>(1-2/08)</sup>

**Units** — Each milligram of penicillin G potassium has 1440 to 1680 USP units. Each milligram of the powder for injection (which contains sodium citrate buffer) has 1355 to 1595 USP units.<sup>(4)</sup>

**pH** — The reconstituted powder for injection has a pH of 6 to 8.5.<sup>(1-2/08)</sup> The frozen premixed infusion solutions have a pH of 5.5 to 8.<sup>(1-2/08)</sup> (4)

**Osmolality** — The frozen premixed penicillin G potassium infusion solutions are iso-osmotic with an osmolality of 300 mOsm/kg.<sup>(1-2/08)</sup>

The osmolality of penicillin G potassium (Pfizer) 250,000 units/mL in sterile water for injection was determined to be 776 mOsm/kg by freezing-point depression and 767 mOsm/kg by vapor pressure.<sup>(1071)</sup> Another report cited the osmolality of this concentration as 749 mOsm/kg.<sup>(50)</sup>

The osmolality of penicillin G potassium 50,000 units/mL was 402 mOsm/kg in dextrose 5% and 414 mOsm/kg in sodium chloride 0.9%. At 100,000 units/mL, the osmolality was 535 mOsm/kg in dextrose 5% and 554 mOsm/kg in sodium chloride 0.9%.<sup>(1375)</sup>

The osmolality of penicillin G potassium was calculated for the following dilutions<sup>(1054)</sup> :

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>3 million units</b>		
Dextrose 5%	411	340
Sodium chloride 0.9%	437	367
<b>5 million units</b>		
Dextrose 5%	501	394
Sodium chloride 0.9%	527	420

The following maximum penicillin G potassium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients<sup>(1180)</sup> :

Diluent	Maximum	Osmolality
---------	---------	------------

	<b>Concentration (mOsm/kg) (units/mL)</b>	
Dextrose 5%	81,568	566
Sodium chloride 0.9%	73,455	545
Sterile water for injection	147,205	513

*Sodium and Potassium Content* — Penicillin G potassium contains, in each million units, 1.7 mEq of potassium and 0.3 mEq of sodium. <sup>(1-2/08)</sup>

**Administration** — NOTE: Do not confuse other forms of penicillin G with penicillin G potassium.

Penicillin G potassium is administered by intramuscular injection or continuous or intermittent intravenous infusion. It may also be administered by intrathecal, intra-articular, and intrapleural injections and other local instillations. Vials containing 20 million units are intended for intravenous administration. For intramuscular injections, concentrations of up to 100,000 units/mL will cause a minimum of discomfort. Higher concentrations may be used when needed. <sup>(1-2/08)</sup> <sup>(4)</sup>

In high doses, intravenous administration should be performed slowly to avoid electrolyte imbalance from the potassium content. For daily doses of 10 million units or more, the drug may be diluted in 1 or 2 L of infusion solution and administered in a 24-hour period. By intermittent intravenous infusion, one-fourth or one-sixth of the daily dose may be given over one to two hours and repeated every six to four hours, respectively. Divided doses are generally infused over 15 to 30 minutes in children and neonates. <sup>(4)</sup>

**Stability** — The drug powder is stable at room temperature. After reconstitution, the drug is stable for seven days under refrigeration. <sup>(1-2/08)</sup> <sup>(4)</sup>

However, penicillin G potassium 500,000 units/mL was stored at room temperature and 4 °C. After 24 hours at room temperature, a new compound formed, which increased by 72 hours. Storage at 4 °C substantially reduced the rate of formation. Although the activity of penicillin G potassium was retained over the time period, its potential as an antigen may change due to formation of polymers or conjugation products that may cause allergic reactions. It was recommended that the drug be freshly prepared before use or refrigerated during storage. <sup>(785)</sup>

Another study found increased formation of specific antipenicillin antibodies in patients administered aged penicillin solutions, not only at room temperature but also 4 °C. The causative antigens were degradation or transformation products of penicillin G. Freshly prepared solutions did not seem to be immunogenic. <sup>(946)</sup>

The activity of penicillin G 6 mg/L was evaluated in peritoneal dialysis fluids containing dextrose 1.5 and 4.25% (Dianeal 137, Travenol). Storage at 25 °C resulted in about a 25% loss of antimicrobial activity in 24 hours. The loss of activity was attributed to the pH (5.2) of the dialysis fluids. <sup>(515)</sup>

However, penicillin G potassium (Parke-Davis) 500,000 units/L in peritoneal dialysis concentrate (Travenol) containing dextrose 30% with and without heparin sodium 2500 units/L underwent substantial reduction in activity within as little as 10 minutes. <sup>(273)</sup>

*pH Effects* — The stability of penicillin G potassium 500,000 units/mL is greatest at pH 7. <sup>(160)</sup> Penicillin G activity rapidly declines at pH 5.5 and below and at pH values above 8. <sup>(47)</sup>

Penicillin G potassium is both an acid- and alkali-labile drug. It should not be mixed with drugs that may result in a final pH outside of its stability range of pH 5.5 to 8. <sup>(47)</sup> Unfortunately, the citrate buffer is of little value in the presence of strongly acidic or alkaline drugs. <sup>(48)</sup>

The times to 10% decomposition of combinations of penicillin G potassium buffered with

multivitamin infusion concentrate in dextrose 5% and sodium chloride 0.9% have been calculated on the basis of the final pH of the admixture<sup>(304)</sup> :

<b>Penicillin G Potassium</b>	<b>Multivitamin Infusion Concentrate</b>	<b>pH</b>	<b>Time to 10% Decomposition</b>
1 million units/L	1 mL/L	5.1	6.51 hr
1 million units/L	5 mL/L	4.9	4.56 hr
3 million units/L	1 mL/L	5.4	13.54 hr
3 million units/L	5 mL/L	5.0	6.38 hr
5 million units/L	1 mL/L	5.7	22.01 hr
5 million units/L	5 mL/L	5.1	6.51 hr
10 million units/L	1 mL/L	5.9	over 24 hr
10 million units/L	5 mL/L	5.4	13.54 hr

*Freezing Solutions* — Frozen premixed infusion solutions of penicillin G potassium are stable for at least 90 days from shipping stored at -20 °C. The frozen solutions should be thawed at room temperature or under refrigeration and, once thawed, should not be refrozen. Thawing should not be performed using a warm water bath or microwave radiation. Thawed solutions are stated to be stable for 24 hours at room temperature and for 14 days under refrigeration.<sup>(4)</sup>

Penicillin G potassium 1 million units/100 mL of dextrose 5% in PVC bags was frozen at -20 °C for 30 days and then thawed by exposure to ambient temperature or microwave radiation. No evidence of precipitation or color change was observed, and a 3 to 4% loss was reported. The thawed solution at room temperature was physically compatible and exhibited no further loss over 24 hours.<sup>(554)</sup>

A fivefold increase in particles of 2 to 60 µm was produced by freezing and thawing penicillin G potassium (Squibb) 2 million units/100 mL of dextrose 5% (Travenol). The constituted drug was filtered through a 0.45-µm filter into PVC bags of solution and frozen for seven days at -20 °C. Thawing was performed at 29 °C for 12 hours. Although the total number of particles increased significantly, no particles greater than 60 µm were observed; the solutions complied with USP standards for particle sizes and numbers in large volume parenteral solutions.<sup>(822)</sup>

Penicillin G potassium 1 million units/50 mL of sodium chloride 0.9% lost 5% in 16 days and 7% in 25 days when frozen at -7 °C. However, samples of the same solution stored at 4 °C showed similar results, indicating a lack of advantage for frozen storage.<sup>(1035)</sup>

*Ambulatory Pumps* — The stability of penicillin G potassium 100,000 and 200,000 units/mL in sterile water for injection was evaluated in PVC portable pump reservoirs (Pharmacia Deltec). A 6% loss occurred in three days at 25 °C. The 200,000-unit/mL concentration was also tested stored at 5 °C. A 3% loss occurred in 14 days.<sup>(2080)</sup>

*Elastomeric Reservoir Pumps* — Penicillin G potassium (Pfizer) 40,000 units/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for two weeks at 35 °C with gentle agitation.<sup>(2014)</sup>

*Filtration* — Filtering penicillin G potassium (Pfizer) through 5-µm stainless steel and 0.22-µm cellulose ester inline filters resulted in no significant reduction in activity under conditions of varying doses, temperatures, flow rates, and administration methods.<sup>(167)</sup>

Penicillin G Potassium (BENZYL PENICILLIN POTASSIUM) - AHFS  
8:12.16.04

## Penicillin G Sodium (BENZYL PENICILLIN SODIUM) - AHFS 8:12.16.04

**Products** — Penicillin G sodium is available in vials containing 5 million units of drug with sodium citrate and citric acid as buffers. Depending on the route of administration, reconstitute the vials with sterile water for injection, dextrose 5%, or sodium chloride 0.9%; reconstitution of the 5 million-unit vial with 3 or 8 mL of diluent results in a final concentration of 1 million or 500,000 units/mL, respectively. Loosen the powder in the vial while holding the vial horizontally, rotate it and add the diluent slowly, directing the stream against the wall of the vial. Shake the vial vigorously. <sup>(1-11/06)</sup> (4)

**Units** — Each milligram of penicillin G sodium has 1500 to 1750 USP units. Each milligram of the powder for injection (which contains sodium citrate buffer) has 1420 to 1667 USP units. <sup>(4)</sup>

**pH** — From 5 to 7.5. <sup>(1-11/06)</sup>

**Osmolality** — Penicillin G sodium 250,000 units/mL in sterile water for injection has an osmolality of 795 mOsm/kg. <sup>(50)</sup>

The osmolality of penicillin G sodium was calculated for the following dilutions <sup>(1054)</sup> :

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
3 million units		
Dextrose 5%	413	341
Sodium chloride 0.9%	439	368
5 million units		
Dextrose 5%	502	394
Sodium chloride 0.9%	529	421

The following maximum penicillin G sodium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients <sup>(1180)</sup> :

Diluent	Maximum Concentration (units/mL)	Osmolality (mOsm/kg)
Dextrose 5%	85,383	573
Sodium chloride 0.9%	76,891	563
Sterile water for injection	154,091	545

**Sodium Content** — Penicillin G sodium contains 1.68 mEq of sodium per million units. <sup>(1-11/06)</sup>

**Administration** — NOTE: Do not confuse other forms of penicillin G with penicillin G sodium.

Penicillin G sodium is administered by intramuscular injection or by continuous or intermittent intravenous infusion. For intramuscular injections, concentrations of up to 100,000 units/mL will cause a minimum of discomfort. Higher concentrations may be used when needed. In high doses, intravenous administration should be performed slowly to avoid electrolyte imbalance from the sodium content. For daily doses of 10 million units or more, the drug may be diluted in 1 or 2 L of infusion solution and administered in a 24-hour period. By intermittent intravenous infusion, one-fourth or one-sixth of the daily dose may be given over one to two hours and repeated every six to four hours, respectively. Divided doses are generally infused over 15 to 30 minutes in children and neonates. <sup>(4)</sup>

**Stability** — The dry powder may be stored at controlled room temperature. After reconstitution, solutions may be stored for three days<sup>(1-11/06)</sup> to seven days<sup>(4)</sup> under refrigeration. Intravenous infusions containing this drug are stable at room temperature for at least 24 hours.<sup>(4)</sup>

The activity of penicillin G 6 mg/L was evaluated in peritoneal dialysis fluids containing dextrose 1.5 and 4.25% (Dianeal 137, Travenol). Storage at 25 °C resulted in about a 25% loss of antimicrobial activity in 24 hours. The loss of activity was attributed to the pH (5.2) of the dialysis fluids.<sup>(515)</sup>

*pH Effects* — At 25 °C, the maximum stability of penicillin G sodium is attained at pH 6.8<sup>(131)</sup>, but little difference in the rate of decomposition occurs in the pH range of 6.5 to 7.5.<sup>(1947)</sup> Not more than 10% loss occurs in 24 hours in a pH range of 5.4 to 8.5.<sup>(131)</sup> Unbuffered penicillin G sodium injection 12 and 48 mg/mL in sodium chloride 0.9% had an initial pH between 5.4 and 5.8. A 7% loss occurred in two days in samples stored at 5 °C. However, reconstituting with citrate buffers having pH values of 6.5, 7.0, and 7.5 resulted in great stability improvement. At these same concentrations in sodium chloride 0.9% in minibags stored at 5 °C, losses of 5 to 7% occurred in 28 days and 10% in 56 days.<sup>(1671)</sup>

*Freezing Solutions* — It has been shown that penicillin G sodium in concentrations of 1 to 10%, buffered to pH 6.85, loses not more than 1% in one month when frozen at -20 °C.<sup>(99)</sup> Another report stated that solutions of penicillin G sodium at a concentration of 50,000 units/mL in water, sodium chloride 0.9%, and 0.05 M citrate buffer and also at a concentration of 500,000 units/mL with sodium citrate 15 mg are stable for at least 12 weeks when frozen at -25 °C. At -5 °C in the citrate buffer, the rate of decomposition is considerably higher than at either -25 or 5 °C.<sup>(156)</sup>

Penicillin G sodium 2.5 million units/50 mL of dextrose 5% in PVC containers was physically compatible and stable for 39 days frozen at -20 °C. Subsequent thawing and storage at 4 °C resulted in a 3 to 4% loss in 10 to 15 days and up to a 10% loss in 31 days.<sup>(1125)</sup>

Little penicillin G sodium loss occurred in a solution containing 180,000 units/mL in sterile water for injection in PVC and glass containers after 30 days at -20 °C. Subsequent thawing and storage for four days at 5 °C, followed by 24 hours at 37 °C to simulate the use of a portable infusion pump, resulted in about a 12 to 16% penicillin loss.<sup>(1391)</sup>

*Ambulatory Pumps* — The stability of penicillin G sodium 100,000 and 200,000 units/mL in sterile water for injection was evaluated in PVC portable pump reservoirs (Pharmacia Deltec). A 4 to 6% loss occurred in three days at 25 °C.<sup>(2080)</sup>

## Compatibility Information

### Solution Compatibility

#### Penicillin G sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%		KA	6 MU <sup>a</sup>	Stable for 24 hr at 25 °C	131	C
Dextrose 5%		BE	20 MU <sup>a</sup>	25% loss in 24 hr at 25 °C	113	I

Penicillin G Sodium (BENZYL PENICILLIN SODIUM) - AHFS 8:12.16.04

## Pentamidine Isethionate - AHFS 8:30.92

**Products** — Pentamidine isethionate is available in vials containing 300 mg in lyophilized form; sodium hydroxide and/or hydrochloric acid may have been added during manufacture to adjust the pH. <sup>(1-12/06)</sup> For intramuscular injection, the contents of a vial should be reconstituted with 3 mL of sterile water for injection to yield a 100-mg/mL concentration. For intravenous administration, the contents of a vial should be reconstituted with 3, 4, or 5 mL of sterile water for injection or dextrose 5% to yield solutions containing 100, 75, or 60 mg/mL, respectively. The dose should be withdrawn and further diluted in 50 to 250 mL of dextrose 5% for administration. <sup>(1-12/06)</sup> <sup>(4)</sup>

Do not use sodium chloride 0.9% to reconstitute pentamidine isethionate because precipitation will occur. <sup>(1-12/06)</sup>

*pH* — Reconstituted solutions of 60 to 100 mg/mL have a pH of approximately 5.4 in sterile water for injection and of 4.09 to 4.38 in dextrose 5%. <sup>(4)</sup>

*Osmolality* — At 100 mg/mL in sterile water for injection and dextrose 5%, the osmolalities are 160 and 455 mOsm/kg, respectively. <sup>(4)</sup>

*Equivalency* — Pentamidine isethionate 1.74 mg is equivalent to pentamidine 1 mg. <sup>(4)</sup>

*Trade Name(s)* — Pentam 300

**Administration** — Pentamidine isethionate injection may be administered by slow intravenous infusion or deep intramuscular injection using the Z-track technique. Intravenously, the calculated dose should be diluted in 50 to 250 mL of dextrose 5% and infused over 60 to 120 minutes. The drug should not be administered by rapid intravenous injection or infusion. <sup>(4)</sup>

**Stability** — The sterile dry powder should be stored at controlled room temperature and protected from light. <sup>(1-12/06)</sup> <sup>(4)</sup>

Reconstituted solutions containing 60 to 100 mg/mL are stable for 48 hours at room temperature protected from light. The reconstituted solution should be kept between 22 and 30 °C to avoid crystallization. <sup>(1-12/06)</sup> <sup>(4)</sup> Because no preservative is present, the manufacturer recommends discarding remaining solution. <sup>(4)</sup>

Pentamidine isethionate in concentrations ranging from about 0.8 to 97 mg/mL in dextrose 5% and about 0.9 to 93 mg/mL in sterile water for injection is reported to be stable for 30 days stored under refrigeration. <sup>(31)</sup>

*Freezing Solutions* — The manufacturer states that crystals may form in pentamidine isethionate solutions if stored below room temperature. <sup>(1-12/06)</sup>

*Elastomeric Reservoir Pumps* — Pentamidine isethionate (Fujisawa) 3 mg/mL in dextrose 5% and 2 mg/mL in sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for two weeks at 35 °C with gentle agitation. <sup>(2014)</sup>

## Pentazocine Lactate - AHFS 28:08.12

**Products** — Pentazocine lactate is supplied in 1-mL ampuls, 1- and 2-mL syringe cartridges, and 10-mL multiple-dose vials. Each milliliter of solution contains <sup>(1-10/06)</sup> :

Component	Ampul	Cartridge	Unit	Vial
Pentazocine (as lactate)	30 mg	30 mg	30 mg	30 mg
Sodium chloride	2.8 mg	2.2 mg	1.5 mg	1.5 mg
Acetone sodium bisulfite		1 mg	2 mg	2 mg
Methylparaben			1 mg	1 mg
Water for injection	qs 1 mL	qs 1 mL	qs 1 mL	qs 1 mL

*pH* — The pH is adjusted to 4 to 5 with lactic acid or sodium hydroxide. <sup>(1-10/06)</sup>

*Osmolality* — The osmolality of pentazocine lactate 30 mg/mL was determined to be 307 mOsm/kg. <sup>(1233)</sup>

*Trade Name(s)* — Talwin

**Administration** — Pentazocine lactate may be administered by intramuscular, subcutaneous, or intravenous injection. For repeated administration, intramuscular injection with constant rotation of the injection sites should be used. Subcutaneous injection should be used only when necessary because of possible tissue damage. <sup>(1-10/06)</sup> <sup>(4)</sup>

**Stability** — Pentazocine lactate injection should be stored at controlled room temperature <sup>(1-10/06)</sup> and protected from temperatures of 40 °C or above and from freezing. Pentazocine lactate is incompatible with alkaline substances. <sup>(4)</sup>

*Syringes* — Pentazocine lactate (Winthrop) 30 mg/1 mL, repackaged in 3-mL clear glass syringes (Hy-Pod) and stored at 25 °C, exhibited no significant changes in pH, physical appearance, or drug concentration during 360 days of storage. <sup>(535)</sup>

## Pentobarbital Sodium - AHFS 28:24.04

**Products** — Pentobarbital sodium 50 mg/mL is available in 20- and 50-mL multiple-dose vials. Each milliliter of solution also contains propylene glycol 40% (v/v), alcohol 10%, and hydrochloric acid and/or sodium hydroxide to adjust pH in water for injection. <sup>(1-3/07)</sup>

*pH* — Adjusted to approximately 9.5. <sup>(1-3/07)</sup>; range 9 to 10.5. <sup>(17)</sup>

*Trade Name(s)* — Nembutal

**Administration** — Pentobarbital sodium may be administered by deep intramuscular injection into a large muscle or by slow intravenous injection. The rate of intravenous administration should not exceed 50 mg/min. No more than 5 mL of solution (250 mg) should be injected intramuscularly at any one site. <sup>(1-3/07)</sup> (4)

**Stability** — Intact vials of pentobarbital sodium should be stored at controlled room temperature and protected from excessive heat and freezing. Brief exposures to temperatures up to 40 °C does not adversely affect the product. <sup>(1-3/07)</sup>

Aqueous solutions of pentobarbital sodium are not stable. The commercially available pentobarbital sodium in a propylene glycol vehicle is more stable. In an acidic medium, pentobarbital sodium may precipitate. <sup>(4)</sup> No solution containing a precipitate or that is cloudy should be used. <sup>(1-3/07)</sup> (4)

Pentobarbital sodium may raise the pH of admixture solutions to the alkaline range and, therefore, should not be mixed with alkali-labile drugs. <sup>(47)</sup>

*Syringes* — Pentobarbital sodium 50 mg/mL was packaged in 1-mL glass and polypropylene syringes and 3-mL polypropylene syringes (Becton Dickinson) and stored at 25 °C. No loss occurred in 31 days. <sup>(2429)</sup>

*Sorption* — Pentobarbital sodium did not undergo sorption to a PVC plastic test strip or PVC infusion solution bag. <sup>(12)</sup> (770)

*Plasticizer Leaching* — Pentobarbital sodium 2 mg/mL in dextrose 5% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24 °C. <sup>(1683)</sup>

*Filtration* — Pentobarbital sodium 600 mg/L and 1.25 g/L in dextrose 5% and also sodium chloride 0.9% was filtered through a 0.45- $\mu$ m filter. The delivered concentration did not decrease. <sup>(754)</sup>

Pentobarbital Sodium - AHFS 28:24.04

## Pentostatin - AHFS 10:00

**Products** — Pentostatin is available as a lyophilized powder in vials containing 10 mg of drug. Also present are 50 mg of mannitol and sodium hydroxide or hydrochloric acid to adjust the pH. Reconstitute the vial contents with 5 mL of sterile water for injection and shake well to yield a 2-mg/mL solution. <sup>(1-8/07)</sup>

*pH* — From 7 to 8.5. <sup>(1-8/07)</sup>

*Trade Name(s)* — Nipent

**Administration** — Pentostatin is administered intravenously by injection over five minutes or by infusion over 20 to 30 minutes when diluted in 25 to 50 mL of dextrose 5% or sodium chloride 0.9%. Adequate hydration is necessary prior to administering pentostatin. Administration of 500 to 1000 mL of dextrose 5% in sodium chloride 0.45% or similar solution prior to drug administration with an additional 500 mL of dextrose 5% or similar solution after drug administration is recommended. <sup>(1-8/07)</sup> (4)

**Stability** — The manufacturer recommends that pentostatin be stored under refrigeration <sup>(1-8/07)</sup>, but other information indicates that the drug in intact vials is stable for at least three years at room temperature. <sup>(234)</sup>

The white to off-white powder yields a colorless solution when reconstituted. The manufacturer states that reconstituted pentostatin solutions are stable at room temperature for up to eight hours only because of the absence of antibacterial preservatives. <sup>(1-8/07)</sup> Other information indicates that the reconstituted solution is stable for 72 hours at room temperature, exhibiting a 2 to 4% loss. <sup>(234)</sup> <sup>(1453)</sup>

Pentostatin (Parke-Davis) 0.03 mg/mL diluted in sodium chloride 0.9% and stored at 22 °C did not exhibit a substantial antimicrobial effect on the growth of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. *C. albicans* maintained viability for 24 hours, and the others were viable for 48 to 120 hours. The author recommended that diluted solutions of pentostatin be stored under refrigeration whenever possible and that the potential for microbiological growth be considered when assigning expiration periods. <sup>(2160)</sup>

*pH Effects* — Pentostatin displays greater decomposition under acidic conditions compared to alkaline conditions. The pH range of maximum stability is about 6.5 to 11.5. At pH 6 to 8, hydrolysis is not sensitive to the ionic strength of the solution. <sup>(1453)</sup>

*Sorption* — Pentostatin does not undergo sorption to PVC containers or administration sets at concentrations between 0.18 and 0.33 mg/mL in dextrose 5% water or sodium chloride 0.9%. <sup>(1-8/07)</sup>

Pentostatin - AHFS 10:00

## Phenobarbital Sodium - AHFS 28:12.04

**Products** — Phenobarbital sodium injection is available in various dosage forms and sizes, including 30, 60, 65, and 130 mg/mL, from several manufacturers. The product formulations also contain ethanol 10%, propylene glycol 67.8 to 75%, and water for injection. Some products also contain benzyl alcohol 1.5% as a preservative. <sup>(1-2/08)</sup> (4)

*pH* — The USP cites the official pH range as 9.2 to 10.2. <sup>(17)</sup>

*Osmolality* — The osmolality of phenobarbital sodium 65 mg/mL was 15,570 mOsm/kg by freezing-point depression and 9285 mOsm/kg by vapor pressure. <sup>(1071)</sup> The osmolality of phenobarbital sodium 200 mg/mL was 10,800 mOsm/kg.

The osmolality of phenobarbital sodium 100 mg was calculated for the following dilutions <sup>(1054)</sup> :

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	296	289
Sodium chloride 0.9%	325	317

*Trade Name(s)* — Luminal Sodium

**Administration** — Phenobarbital sodium is administered by intramuscular injection into a large muscle and slow intravenous injection. The commercial injection is highly alkaline and may cause local tissue damage. Do not administer subcutaneously. When given intravenously, the rate of injection should not exceed 60 mg/min. <sup>(1-2/08)</sup> (4)

**Stability** — Phenobarbital sodium injection in intact containers should be stored at controlled room temperature and protected from light. <sup>(1-2/08)</sup>

Phenobarbital sodium under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38 °C over four weeks. Analysis found no loss of the drug under these conditions. <sup>(2562)</sup>

Phenobarbital sodium is not generally considered stable in aqueous solutions. <sup>(4)</sup> However, a test of phenobarbital sodium 10% (w/v) in aqueous solution showed 7% decomposition in four weeks when stored at 20 °C. There was no measurable decomposition in eight weeks with storage at -25 °C. <sup>(233)</sup>

In addition, the stability of phenobarbital sodium diluted to a 10-mg/mL concentration in sodium chloride 0.9% for use in infants was studied. When stored at 4 °C, the dilution was physically compatible with no loss of drug over 28 days. <sup>(1294)</sup>

Phenobarbital may precipitate from solutions of phenobarbital sodium, depending on the concentration and acidic pH. <sup>(4)</sup> No solution containing a precipitate or that is more than slightly discolored should be used. <sup>(1-2/08)</sup> (4)

Phenobarbital sodium may raise the pH of admixture solutions to the alkaline range and, therefore, should not be mixed with alkali-labile drugs. <sup>(47)</sup>

*Plasticizer Leaching* — Phenobarbital sodium 6 mg/mL in dextrose 5% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24 °C. <sup>(1683)</sup>

*Filtration* — Phenobarbital sodium 130 mg/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated, filtered over 12 hours through a 5- $\mu$ m stainless steel depth filter (Argyle Filter

Connector), a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2 Filter Set), and a 0.22- $\mu$ m polycarbonate membrane filter (In-Sure Filter Set), showed no loss due to binding to the filters. <sup>(320)</sup>

## Phentolamine Mesylate - AHFS 12:16.04.04

**Products** — Phentolamine mesylate is available in vials containing 5 mg of drug with 25 mg of mannitol as a lyophilized powder. Reconstitution with 1 mL of sterile water for injection results in a 5-mg/mL solution. <sup>(1-4/06)</sup> (4)

*pH* — From 4.5 to 6.5. <sup>(4)</sup>

**Administration** — Phentolamine mesylate may be administered by intramuscular or intravenous injection. <sup>(1-4/06)</sup> (4)

**Stability** — The intact vials should be stored at controlled room temperature. <sup>(1-4/06)</sup> (4) Although the manufacturer recommends that reconstituted solutions be used immediately and not stored <sup>(1-4/06)</sup>, other information indicates that such solutions are stable for 48 hours at room temperature and one week at 2 to 8 °C. <sup>(4)</sup>

*Sorption* — Phentolamine mesylate was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(536)</sup> (606)

Phentolamine Mesylate - AHFS 12:16.04.04

## Phenylephrine Hydrochloride - AHFS 12:12.04

**Products** — Phenylephrine hydrochloride is available as a 1% solution in 1-mL ampuls and 1- and 5-mL vials. Each milliliter of solution contains phenylephrine hydrochloride 10 mg with sodium citrate and citric acid buffer, sodium chloride, and sodium metabisulfite antioxidant. The pH may have been adjusted during manufacture. <sup>(1-11/05)</sup> (4)

*pH* — From 3 to 6.5. <sup>(17)</sup>

**Administration** — Phenylephrine hydrochloride is administered by subcutaneous, intramuscular, or direct slow intravenous injection or by intravenous infusion. For direct intravenous injection, a 0.1% solution (1 mg/mL) may be prepared by diluting 1 mL of phenylephrine hydrochloride with 9 mL of sterile water for injection. Solutions for intravenous infusion are usually prepared by adding 10 mg of drug to 500 mL of dextrose 5% or sodium chloride 0.9%. <sup>(1-11/05)</sup> (4)

**Stability** — Intact containers of phenylephrine hydrochloride should be stored at controlled room temperature and protected from light. <sup>(1-11/05)</sup> (4) Solutions of the drug must not be used if they are brown or contain a precipitate. However, oxidation may occur, resulting in loss of activity even though no color change is evident. <sup>(4)</sup>

Phenylephrine hydrochloride was stable for 84 days at 60 °C in a 250-mg/100 mL concentration in sterile water for injection. <sup>(132)</sup>

Phenylephrine hydrochloride in dextrose 5% is stated to be stable for at least 48 hours at pH 3.5 to 7.5. <sup>(4)</sup>

**Syringes** — Phenylephrine hydrochloride (Gensia Sicor) 0.1 mg/mL packaged in polypropylene plastic syringes fitted with tip seals and stored at 23 to 25 °C in fluorescent light and at 3 to 5 °C and at -20 °C in the dark for 30 days exhibited no precipitation, cloudiness, or color change and virtually no loss of drug. <sup>(2737)</sup>

**Central Venous Catheter** — Phenylephrine hydrochloride (Ohmeda) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

Phenylephrine Hydrochloride - AHFS 12:12.04

## Phenytoin Sodium - AHFS 28:12.12

**Products** — Phenytoin sodium 50 mg/mL is available as a ready-mixed solution in 2 mL vials, ampuls, and syringe cartridges and 5 mL vials. Each milliliter of solution also contains propylene glycol 40%, alcohol 10%, and sodium hydroxide to adjust pH in water for injection. <sup>(1-1/08)</sup>

**CAUTION:** Care should be taken to avoid confusion between phenytoin sodium and fosphenytoin sodium to prevent dosing errors.

**pH** — From 10 to 12.3. <sup>(1-1/08)</sup> <sup>(17)</sup> The pH is adjusted to about 12 during manufacture. <sup>(4)</sup>

**Osmolality** — The osmolality of phenytoin sodium 50 mg/mL was 9740 mOsm/kg by freezing-point depression and 6175 mOsm/kg by vapor pressure. <sup>(1071)</sup> Another report indicated that the osmolality was 3035 mOsm/kg by freezing-point depression. <sup>(1233)</sup>

The osmolality of phenytoin sodium 500 mg in 50 and 100 mL of sodium chloride 0.9% was calculated to be 336 and 312 mOsm/kg, respectively. <sup>(1054)</sup>

**Sodium Content** — Each milliliter of phenytoin sodium injection contains 0.2 mEq of sodium. <sup>(4)</sup>

**Administration** — Phenytoin sodium is preferably administered by direct intravenous injection into a large vein through a large-gauge needle or intravenous catheter. Although intramuscular injection can be used, erratic or delayed absorption may occur. Subcutaneous injection should be avoided because of the possibility of local tissue damage. The rate of intravenous injection should not exceed 50 mg/min in adults or 1 to 3 mg/kg/min in neonates. Following intravenous injection, sodium chloride 0.9% should be injected through the same needle or catheter to reduce irritation. <sup>(1-1/08)</sup> <sup>(4)</sup>

Because of the drug's low solubility and possible precipitation, intravenous infusion is usually not recommended. However, some clinicians have suggested that intravenous infusion is reasonable in an appropriately diluted, compatible infusion solution for short periods using inline filtration; they have advocated infusion to circumvent the adverse effects associated with direct intravenous injection. <sup>(1-1/08)</sup> <sup>(4)</sup>

**Stability** — Intact containers should be stored at controlled room temperature and protected from freezing. Phenytoin sodium is stable as long as it remains free of haziness and precipitation. If refrigerated or frozen, a precipitate may form, but it dissolves on standing at room temperature. On dissolution of the precipitate, the product is still suitable for use. Also, a faint yellow color, which has no effect on concentration, may sometimes develop in the injection. <sup>(1-1/08)</sup> <sup>(4)</sup>

**Precipitation** — Precipitation of free phenytoin occurs at pH 11.5 or less. <sup>(4)</sup>

The mixing of phenytoin sodium with other drugs or with intravenous infusion solutions is not recommended <sup>(1-1/08)</sup> <sup>(4)</sup> because the solubility of phenytoin sodium is such that crystallization or precipitation may result if the special vehicle is altered or the pH is lowered. <sup>(62)</sup> <sup>(63)</sup> <sup>(613)</sup> Unfortunately, direct intravenous injection of phenytoin sodium is inconvenient and is occasionally associated with significant cardiovascular side effects. <sup>(1-1/08)</sup> <sup>(4)</sup> In spite of the caveat against dilution, some clinicians have advocated the infusion of phenytoin sodium <sup>(443)</sup> <sup>(448)</sup> <sup>(611)</sup> <sup>(947)</sup> <sup>(948)</sup> <sup>(949)</sup> <sup>(950)</sup> <sup>(1295)</sup> or administration into the tubing of a running infusion solution. <sup>(63)</sup> <sup>(65)</sup> <sup>(338)</sup> <sup>(445)</sup>

There are a number of reports of phenytoin crystallization in infusion solutions within varying periods after dilution. While the time to crystal formation may be variable and difficult to predict, crystal formation is nonetheless inevitable. <sup>(65)</sup> <sup>(66)</sup> <sup>(305)</sup> <sup>(306)</sup> <sup>(447)</sup> <sup>(449)</sup> <sup>(450)</sup> <sup>(451)</sup> <sup>(708)</sup> <sup>(709)</sup> <sup>(710)</sup> <sup>(1421)</sup>

The relationship of phenytoin sodium solubility to various solution characteristics was explored. It was noted that the effect of the special solvent system could be disregarded in dilutions of 1:5 or more. The pH of the admixture was stated to be the primary determinant of the occurrence or absence of crystallization. With a given solution, the pH is dependent on the volume of dilution, with a lower pH resulting from greater dilution. Phenytoin becomes less soluble in aqueous solution as the pH drops. Equations for predicting the compatibility of phenytoin sodium in admixture solutions were presented, but it was noted that it is not possible to predict the time required to develop precipitation.<sup>(713)</sup>

Although some may feel that infusion of phenytoin sodium is, perhaps, too dangerous to perform clinically<sup>(452)</sup>, others indicate that such administration may be feasible provided proper precautions are taken such as using a suitable vehicle (i.e., sodium chloride 0.9% or Ringer's injection, lactated), using a sufficiently concentrated solution, starting the infusion immediately after preparation and completing administration within a relatively short time, using a 0.22-µm inline filter, and watching the admixture very carefully.<sup>(305) (306) (453) (611) (612) (613) (708) (709) (710) (947) (948) (949) (950) (1295)</sup>

Phenytoin precipitate may form if the injection contacts more acidic drugs or infusion solutions such as dextrose 5% during administration. Such precipitation has been found to occlude catheters. Instilling 5 mL of 8.4% sodium bicarbonate injection at 15- to 30-minute intervals has cleared catheters occluded with phenytoin precipitate. The sodium bicarbonate apparently raised the pH enough to result in dissolution of a sufficient amount of the phenytoin precipitate to reopen the catheter.<sup>(2299) (2300)</sup> However, the safety is uncertain because it is not known if some of the precipitated phenytoin is delivered into the bloodstream upon opening the occlusion.

*Sorption* — Phenytoin sodium was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>(536) (606)</sup>

*Plasticizer Leaching* — Phenytoin sodium 10 mg/mL in sodium chloride 0.9% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24 °C.<sup>(1683)</sup>

*Filtration* — Phenytoin sodium 250 mg/5 mL was filtered at a rate of 1 mL/min through a 5-µm stainless steel depth filter (Argyle Filter Connector). No reduction due to binding to the filter was observed.<sup>(320)</sup>

Phenytoin Sodium - AHFS 28:12.12

## Phytonadione (PHYTOMENADIONE) - AHFS 88:24

**Products** — Phytonadione is available as a 2-mg/mL aqueous dispersion in 0.5-mL ampuls and as a 10-mg/mL aqueous dispersion in 1-mL ampuls and 5-mL vials. Each milliliter also contains polyoxyethylated fatty acid 70 mg, dextrose 37.5 mg, and benzyl alcohol 0.9% in water for injection. (1-8/06)

*pH* — The USP cites the official pH range as 3.5 to 7. (17) Phytonadione (Hospira) has a pH of 5 to 7. (1-8/06)

*Osmolality* — The osmolality of phytonadione 10 mg/mL was 325 mOsm/kg by freezing-point depression and 303 mOsm/kg by vapor pressure. (1071)

**Administration** — The intramuscular or subcutaneous routes are preferred for phytonadione. If intravenous injection is unavoidable, phytonadione may be given by direct intravenous injection at a rate not exceeding 1 mg/min or by intravenous infusion. (1-8/06) (4)

**Stability** — Phytonadione injection is available as an essentially clear yellow liquid. Phytonadione is photosensitive and should be protected from light at all times. (1-8/06) (4) When dilutions are indicated, administration should start immediately after mixing with the diluent; unused portions of the dilution, as well as unused contents of the ampul, should be discarded. (4)

*Light Effects* — A study of phytonadione in intravenous solutions showed 50% decomposition in 15 days under fluorescent light and 43 to 63% in three hours on exposure to sunlight. (463) A 10 to 15% loss occurs over 24 hours on exposure to fluorescent light or sunlight. (854) It has been recommended that infusion solutions containing phytonadione require wrapping the container with aluminum foil or other opaque material for light protection. (4)

The loss of phytonadione (Roche) 0.05 to 0.1 mg/mL from solutions in glass and polypropylene containers unprotected or packaged in light-protective overwraps when exposed to neon light and daylight was evaluated. Losses approached 80% in one day unprotected from light exposure. A brown polyethylene light protection bag provided the best protection, yielding no phytonadione loss during a seven-day exposure period. A white "light-tight" light-protective overwrap and a black plastic waste disposal bag failed to protect the phytonadione completely. In the black bag, phytonadione losses of over 30% occurred in seven days; the white light-protective overwrap was worse, allowing loss of nearly half of the phytonadione in one day. Substantial differences in light protection are afforded by the different materials and the efficacy of purported light-protection barriers for light-sensitive drugs should be validated prior to use. (1923)

Substantial loss of phytonadione from both TPN and TNA admixtures due to exposure to sunlight was reported. In three hours of exposure to sunlight, 50% loss of phytonadione had occurred. The presence or absence of lipids did not affect stability. (2049)

*Filtration* — The manufacturer states that phytonadione passes through an inline filter with negligible loss occurring. (854)

### Compatibility Information

Phytonadione (PHYTOMENADIONE) - AHFS 88:24

## Piperacillin Sodium-Tazobactam Sodium - AHFS 8:12.16.16

**Products** — Piperacillin sodium-tazobactam sodium is available in vials containing 2.25 g (piperacillin 2 g plus tazobactam 250 mg), 3.375 g (piperacillin 3 g plus tazobactam 375 mg), and 4.5 g (piperacillin 4 g plus tazobactam 500 mg) as sodium salts. The drug is also available in a pharmacy bulk package containing 40.5 g (piperacillin 36 plus tazobactam 4.5) as sodium salts. The Zosyn products contain EDTA 0.25 mg per gram of piperacillin. Other products do not have EDTA in their formulations. The pH may have been adjusted during manufacture with sodium bicarbonate and hydrochloric acid. <sup>(1-11/07)</sup> (4)

Each gram of piperacillin should be reconstituted with at least 5 mL of sterile water for injection, sodium chloride 0.9%, bacteriostatic water for injection or bacteriostatic sodium chloride 0.9% (preserved with benzyl alcohol or parabens), or dextrose 5% and shaken well until dissolved. Dilute in at least 50 mL of compatible infusion solution for intermittent infusion. <sup>(1-11/07)</sup>

The pharmacy bulk package is reconstituted with 152 mL of compatible diluent to yield a solution containing 200 mg/mL of piperacillin and 25 mg/mL of tazobactam. The reconstituted pharmacy bulk package solution must be diluted further for use. <sup>(4)</sup>

Piperacillin sodium-tazobactam sodium (Zosyn) is also available as frozen iso-osmotic injections containing piperacillin sodium 40 mg/mL with tazobactam 5 mg/mL and piperacillin sodium 60 mg/mL with tazobactam sodium 7.5 mg/mL and EDTA. <sup>(1-11/07)</sup> (4)

*pH* — Vials: From 4.5 to 6.8. <sup>(4)</sup> Frozen premixed solution: From 5.5 to 6.8. <sup>(1-11/07)</sup>

*Trade Name(s)* — Zosyn

**Administration** — Piperacillin sodium-tazobactam sodium should be administered by intravenous infusion over at least 30 minutes after dilution to at least 50 mL in a compatible diluent. It can also be infused using ambulatory infusion pumps. <sup>(1-11/07)</sup> (4)

**Stability** — The white to off-white lyophilized powder in intact vials should be stored at controlled room temperature. <sup>(1-11/07)</sup>

Single-dose vials of the solution should be used immediately after reconstitution. Any remaining portion should be discarded after 24 hours at room temperature or 48 hours under refrigeration at 2 to 8 °C. <sup>(1-11/07)</sup> (4)

In compatible infusion solutions, the drug is stable for up to 24 hours at room temperature or one week under refrigeration. Glass and plastic (including syringes, intravenous solution bags, and tubing) do not affect stability. <sup>(1-11/07)</sup>

The physical and chemical stability of piperacillin sodium-tazobactam sodium at concentrations of 200 and 25 mcg/mL, respectively, were evaluated in Dianeal PD-2 with dextrose 1.5% and Dianeal PD-2 with dextrose 4.25%. Samples were stored at 4 °C for 14 days, 23 °C for seven days, and 37 °C for one day. The samples were physically and chemically stable. Little or no loss of either component occurred in the 4 °C samples throughout the 14-day period. At 23 °C, losses of each component were in the range of 3 to 6% in seven days. The one-day losses at 37 °C were similarly small. <sup>(2018)</sup>

*Freezing Solutions* — The commercially available frozen injections should be stored at or below -20 °C. Thaw at room temperature or under refrigeration but not in a warm water bath or by microwave radiation. Thawed solutions should not be refrozen. After thawing, the solutions are stable for 24 hours at room temperature or 14 days refrigerated. <sup>(1-11/07)</sup> (4)

Piperacillin sodium-tazobactam sodium 80 + 10 mg/mL in PVC bags of dextrose 5% and sodium chloride 0.9% was frozen at -15 °C for 30 days and thawed by microwave radiation for 45 seconds with no loss of either component. <sup>(1768)</sup>

Piperacillin sodium-tazobactam sodium 150 + 18.75 mg/mL and 200 + 25 mg/mL in dextrose 5% and sodium chloride 0.9% was drawn as 20-mL aliquots into polypropylene syringes (Becton Dickinson). The syringes were frozen at -15 °C for 30 days and then stored at 4 °C for seven days with no loss of either component. <sup>(1768)</sup>

Piperacillin sodium-tazobactam sodium 40 + 5 mg/mL in dextrose 5% lost less than 3% after three months stored at -20 °C. After microwave thawing, refrigerated storage resulted in 10% loss in 35 days. <sup>(2614)</sup>

*Syringes* — Piperacillin sodium-tazobactam sodium 150 + 18.75 mg/mL and 200 + 25 mg/mL in dextrose 5% and sodium chloride 0.9% was drawn as 20-mL aliquots into polypropylene syringes (Becton Dickinson). The syringes were stored at 25 °C for one day and at 4 °C for seven days with no loss of either drug in the dextrose 5% samples. Similarly, no tazobactam loss occurred in the sodium chloride 0.9% solutions. However, piperacillin losses of 7% in one day at 25 °C and 4% in seven days at 4 °C were found in the sodium chloride 0.9% solutions. <sup>(1768)</sup>

*Ambulatory Pumps* — The product was shown to be stable for up to 12 hours in an ambulatory infusion pump. Each dose was diluted to 25 or 37.5 mL, and stability was not affected. <sup>(1-11/07)</sup>

*Central Venous Catheter* — Piperacillin sodium-tazobactam sodium (Lederle) 10 + 1.25 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Piperacillin sodium-tazobactam sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%				Compatible	<a href="#">1(11/07)</a>	C
Dextrose 5%	BA <sup>a</sup>	WY <sup>d</sup>	20 <sup>e</sup> , 80 <sup>e</sup> g	Visually compatible. Little loss of either drug in 28 days at 5 °C then 72 hr at 23 °C in light	<a href="#">2806</a>	C
Ringer's injection, lactated		c		Incompatible	<a href="#">1(11/07)</a>	I
Ringer's injection, lactated		WY <sup>d</sup>		Compatible	<a href="#">1(11/07)</a>	C
Sodium chloride 0.9%				Compatible	<a href="#">1(11/07)</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	WY <sup>c</sup>	40 <sup>e</sup> g	Calculated 10% loss in 5.8 days at 7 °C and 3.8 days at room temperature in light	<a href="#">2667</a>	C
Sodium chloride 0.9%	BA <sup>b</sup>	WY <sup>c</sup>	40 <sup>e</sup> g	Calculated 10% loss in 17.7 days at 7 °C and 2.8 days at room temperature in light	<a href="#">2667</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	WY <sup>c</sup>	20 <sup>e</sup> , 80 <sup>e</sup> g	Visually compatible. 5% tazobactam and 2% piperacillin loss in 28 days at 5 °C then 72 hr at 23 °C in light	<a href="#">2806</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polyolefin containers.

<sup>c</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup>Test performed using the formulation WITH edetate disodium.

<sup>e</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

### Drugs in Syringe Compatibility

#### Piperacillin sodium-tazobactam sodium

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Dimenhydrinate		10 mg/1 mL	<sup>a</sup>	200 mg/1 mL	<sup>b</sup> Clear solution	<a href="#">2569</a>	C
Pantoprazole sodium	<sup>a</sup>	4 mg/1 mL	<sup>a</sup>	200 mg/1 mL	<sup>b</sup> Precipitates within 1 hr	<a href="#">2574</a>	I

<sup>a</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>b</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

### Y-Site Injection Compatibility (1:1 Mixture)

Vinblastine sulfate	LI	0.12 mg/mL <sup>a</sup>	LE <sup>g</sup>	40 mg/mL <sup>ai</sup>	Physically compatible for 4 hr at 22 °C	<a href="#">1688</a>	C

Vincristine sulfate	LI	0.05 mg/mL <sup>a</sup>	LE <sup>g</sup>	40 mg/mL <sup>ai</sup>	Physically compatible for 4 hr at 22 °C	<a href="#">1688</a>	C
Zidovudine	BW	4 mg/mL <sup>a</sup>	LE <sup>g</sup>	40 mg/mL <sup>ai</sup>	Physically compatible for 4 hr at 22 °C	<a href="#">1688</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>d</sup>Tested in sterile water for injection.

<sup>e</sup>Tested in Ringer's injection, lactated.

<sup>f</sup>Injected via Y-site into an administration set running azithromycin.

<sup>g</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>h</sup>Test performed using the formulation WITH edetate disodium.

<sup>i</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>j</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

Piperacillin Sodium-Tazobactam Sodium - AHFS 8:12.16.16

## Polymyxin B Sulfate - AHFS 8:12.28.28

**Products** — Polymyxin B sulfate is available in 10-mL vials containing 500,000 units of polymyxin B. For intramuscular injection, reconstitute the vial with 2 mL of sterile water for injection or sodium chloride 0.9%. For intravenous infusion, dilute 500,000 units in 300 to 500 mL of dextrose 5%. For intrathecal administration, reconstitute the vial with 10 mL of sodium chloride 0.9%.<sup>(1-2/04)</sup> (4)

**Units** — Each milligram of polymyxin base is equivalent to 10,000 units. Each microgram is equivalent to 10 units.<sup>(4)</sup>

**pH** — From 5 to 7.5.<sup>(4)</sup>

**Administration** — Polymyxin B sulfate is usually administered by intravenous infusion; 500,000 units is added to 300 to 500 mL of dextrose 5% (providing 1667 to 1000 units/mL) and is administered over 60 to 90 minutes. The drug may also be administered intrathecally as a 50,000-units/mL solution in sodium chloride 0.9%. Although it may be administered by deep intramuscular injection in the upper outer quadrant of the gluteal muscles, this route is generally not recommended, because severe pain at the injection site results.<sup>(4)</sup>

**Stability** — Intact vials should be stored at controlled room temperature and protected from light. Aqueous solutions in the pH range of 5 to 7.5 are stable for six to 12 months under refrigeration. However, it is recommended that unused portions of the reconstituted solution be discarded after 72 hours. Polymyxin B sulfate is inactivated in strongly acidic or alkaline solutions.<sup>(4)</sup> The pH of maximum stability is pH 3.4.<sup>(2422)</sup> In the pH range of 2 to 7, pH has little effect on the rate of decomposition. However, as pH values become more alkaline, the rate of decomposition increases markedly.<sup>(1946)</sup>

### Compatibility Information

#### Solution Compatibility

##### Polymyxin B sulfate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Sodium chloride 0.9%	HOS	APP, BED, XGN	56 to 78 mg	Under 10% loss in 24 hr at 4 and 23 °C	<a href="#">2816</a>	C
TPN #52, #53 <sup>a</sup>		NOV	40 mg	Physically compatible with no polymyxin loss in 24 hr at 29 °C	<a href="#">440</a>	C

<sup>a</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

## Potassium Acetate - AHFS 40:12

**Products** — Potassium acetate additive solution is available in 20-, 50-, and 100-mL single-dose vials at a concentration of 2 mEq/mL in water for injection. Each milliliter provides potassium acetate 196 mg. It is also available in 50-mL vials at a concentration of 4 mEq/mL in water for injection. Each milliliter provides 392 mg of potassium acetate. The pH of the solutions may have been adjusted with acetic acid when necessary. These concentrated solutions must be diluted for administration. <sup>(1-9/06)</sup>

**pH** — The pH of potassium acetate additive solution has been stated to be approximately 7.1 to 7.7<sup>(4)</sup> with a range of 5.5 to 8. <sup>(1-9/06)</sup>

**Osmolarity** — The osmolarity of the 2-mEq/mL solution is 4000 mOsm/L and the 4-mEq/mL solution is 8000 mOsm/L. <sup>(1-9/06)</sup>

**Administration** — Potassium acetate is administered as a dilute solution by slow intravenous infusion. It must not be administered undiluted. <sup>(1-9/06)</sup> <sup>(4)</sup> In most cases, the maximum recommended concentration is 40 mEq/L. Solutions generally may be infused at a rate up to 20 mEq/hr. <sup>(4)</sup>

**Stability** — Potassium acetate additive solution should be stored at room temperature and protected from freezing. It should not be administered unless the solution is clear. <sup>(1-9/06)</sup>

Potassium Acetate - AHFS 40:12

## Potassium Chloride - AHFS 40:12

**Products** — Potassium chloride is available as concentrated solutions of 1.5 and 2 mEq/mL in 10-, 20-, 30-, and 40-mEq sizes in water for injection in ampuls, vials, and syringes. It is also available in a 30-mL (60-mEq) multiple-dose vial containing methylparaben 0.05% and propylparaben 0.005% as preservatives and 250-mL pharmacy bulk packages. The pH may have been adjusted with hydrochloric acid and if necessary potassium hydroxide during manufacture. The concentrated solutions must be diluted for use.<sup>(1-5/06)</sup>

Potassium chloride is also available premixed in infusion solutions in concentrations of 10, 20, 30, and 40 mEq/L.<sup>(4)</sup>

*pH* — The pH is usually near 4.6 with a range of 4 to 8.<sup>(1-5/06) (17)</sup>

*Osmolarity* — The injections are very hypertonic; the 2-mEq/mL concentration has an osmolarity of 4000 mOsm/L. The injection must be diluted for use.<sup>(1-5/06)</sup>

The osmolality of potassium chloride (Abbott) 2 mEq/mL was determined to be 4355 mOsm/kg by freezing-point depression and 3440 mOsm/kg by vapor pressure.<sup>(1071)</sup>

The osmolality of a potassium chloride 7.5% solution was determined to be 1895 mOsm/kg.<sup>(1233)</sup>

**Administration** — Potassium chloride in the concentrated injections must be diluted before slow intravenous administration. Mix potassium chloride injection thoroughly with the infusion solution before administration. The usual maximum concentration is 40 mEq/L. Extravasation should be avoided.<sup>(1-5/06) (4)</sup>

Great care is required when adding potassium chloride to infusion solutions, whether in flexible plastic containers or in rigid bottles. Adding potassium chloride to running infusion solutions hanging in the use position, especially in flexible containers, has resulted in the pooling of potassium chloride and a resultant high-concentration bolus of the drug being administered to patients, with serious and even fatal consequences. Attempts to mix adequately the potassium chloride in flexible containers by squeezing the container in the hanging position were unsuccessful. It is recommended that drugs be admixed with solutions in flexible containers when positioned with the injection arm of the container uppermost. With both rigid bottles and flexible containers, subsequent repeated inversion and agitation to effect thorough mixture are necessary.<sup>(85) (130) (454) (455) (456) (714) (715) (1127) (1778) (2151)</sup>

**Stability** — The solution should be stored at controlled room temperature and used only if it is clear.<sup>(1-5/06)</sup>

Potassium chloride injection 80 mEq/L added to dextrose 5% contained in glass bottles results in a leaching of precipitates consisting of silica and alumina.<sup>(129)</sup>

Metoclopramide HCl	RB	10 and 160 mg	ES	30 mEq	NS	Physically compatible for 48 hr at room temperature	<a href="#">924</a>	C
Mitoxantrone HCl	LE	500 mg		50 mEq	D5W	Visually compatible. Mitoxantrone stable for 24 hr at room temperature	<a href="#">1531</a>	C
Nafcillin sodium	WY	500 mg	AB	40 mEq		Physically compatible	<a href="#">27</a>	C
Nafcillin sodium	WY	30 g	TR	40 mEq	NS	Nafcillin stable for 24 hr at 25 °C	<a href="#">27</a>	C

Nicardipine HCl	DME	50 and 500 mg	ES	40 mEq	D5W <sup>b</sup>	Physically compatible. Little loss in 7 days at room temperature in light	<a href="#">1380</a>	C
Nicardipine HCl	DME	50 and 500 mg	ES	40 mEq	D5W <sup>a</sup>	Physically compatible. 12% loss in 7 days at room temperature in light	<a href="#">1380</a>	C
Norepinephrine bitartrate	WI	8 mg		3 g	D5W	Physically compatible	<a href="#">74</a>	C
Norepinephrine bitartrate	WI	8 mg	AB	40 mEq	D, D-S, S	Physically compatible	<a href="#">77</a>	C
Oxacillin sodium	BR	1, 2.5, 4 g		20, 40, 80 mEq	D5S, D5W	Therapeutic availability maintained	<a href="#">110</a>	C
Penicillin G potassium	SQ	5 million units	AB	40 mEq		Physically compatible	<a href="#">47</a>	C
Penicillin G potassium	SQ	5 million units		40 mEq	D5S, D5W	Therapeutic availability maintained	<a href="#">110</a>	C
Penicillin G potassium	SQ	1 million units		20 mEq	D5S, D5W	Therapeutic availability maintained	<a href="#">110</a>	C
Penicillin G sodium	KA	6 million units		40 mEq	D5W	Penicillin stable for 24 hr at 25 °C	<a href="#">131</a>	C
Penicillin G sodium	KA	5 million units		40 mEq	IS10	pH outside stability range for penicillin	<a href="#">131</a>	I
Phenylephrine HCl	WI	2.5 g	AB	40 mEq	D5W	Phenylephrine stable for 24 hr at 22 °C	<a href="#">132</a>	C
Ranitidine HCl	GL	2 g	LY	10 and 60 mEq	D5W, NS <sup>a</sup>	Physically compatible. 2% ranitidine loss in 48 hr at room temperature in light	<a href="#">1361</a>	C
Ranitidine HCl	GL	50 mg	LY	10 and 60 mEq	NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature in light	<a href="#">1361</a>	C
Ranitidine HCl	GL	50 mg	LY	10 and 60 mEq	D5W <sup>a</sup>	Physically compatible. 7% ranitidine loss in 48 hr at room temperature in light	<a href="#">1361</a>	C
Ranitidine HCl	GL	50 mg and 2 g		80 mEq	D5S, D5W, NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C	<a href="#">1515</a>	C

Sodium bicarbonate	AB	2.4 mEq <sup>d</sup>		120 mEq	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Vancomycin HCl	LI	1 g		3 g	D5W	Physically compatible	<a href="#">74</a>	C
Verapamil HCl	KN	80 mg	TR	80 mEq	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in glass containers.

<sup>c</sup>Concentration expressed in milligrams of phenytoin sodium equivalents (PE) per milliliter.

<sup>d</sup>One vial of Neut added to a liter of admixture.

### Drugs in Syringe Compatibility

#### Potassium chloride

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Dimenhydrinate		10 mg/1 mL	2	mEq/1 mL	Precipitate forms in about 1 hr	<a href="#">2569</a>	I
Hydromorphone HCl	KN	50 mg/1 mL	AST	2 mEq/1 mL	Visually compatible for 24 hr at room temperature	<a href="#">2410</a>	C
Pantoprazole sodium	<sup>a</sup>	4 mg/1 mL	2	mEq/1 mL	Clear solution	<a href="#">2574</a>	C

<sup>a</sup>Test performed using the formulation WITHOUT edetate disodium.

### Y-Site Injection Compatibility (1:1 Mixture)

#### Potassium chloride

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Acetaminophen	CAD	10 mg/mL	HOS, BED	0.1 mEq/mL <sup>b</sup>	Physically compatible with less than 10% acetaminophen loss over 4 hr at room temperature	<a href="#">2841</a> <a href="#">2844</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>d</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>e</sup>Tested in sodium chloride 0.45%.

<sup>f</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>g</sup>Tested in sterile water for injection.

<sup>h</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>i</sup>Tested in Ringer's injection, lactated.

<sup>j</sup>Tested in dextrose 5% in Ringer's injection.

<sup>k</sup>Tested in dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>l</sup>Lyophilized formulation tested.

<sup>m</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>n</sup>Tested in dextrose 5% in sodium chloride 0.45%.

<sup>o</sup>Tested in dextrose 5% in sodium chloride 0.225%.

<sup>p</sup>Tested with albumin human 0.1%.

<sup>q</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>r</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>s</sup>Quinupristin and dalfopristin components combined.

### **Additional Compatibility Information**

*Methylprednisolone* — The compatibility of methylprednisolone sodium succinate (Upjohn) with potassium chloride added to an auxiliary medication infusion unit has been studied. Primary admixtures were prepared by adding potassium chloride 40 mEq/L to dextrose 5%, dextrose 5% in sodium chloride 0.9%, and Ringer's injection, lactated. The primary admixture was added along with methylprednisolone sodium succinate (Upjohn) to the auxiliary medication infusion unit with the following results<sup>(329)</sup> :

<b>Methylprednisolone Sodium Succinate</b>	<b>Potassium Chloride 40 mEq/L Primary Solution</b>	<b>Results</b>
500 mg	D5S, D5W, LR qs 100 mL	Clear solution for 24 hr
1000 mg	D5W qs 100 mL	Clear solution for 24 hr
1000 mg	D5S, LR qs 100 mL	Clear solution for 6 hr
2000 mg	D5S, D5W, LR qs 100 mL	Clear solution for 24 hr

Potassium Chloride - AHFS 40:12

## Potassium Phosphates - AHFS 40:12

**Products** — Potassium phosphates injection is available in single-dose vials containing 5 or 15 mL of solution and 50-mL bulk additive solution containers. Each milliliter of solution contains monobasic potassium phosphate 224 mg and dibasic potassium phosphate 236 mg in water for injection. The phosphate concentration of the solution is 3 mmol/mL, and the potassium content is 4.4 mEq/mL. This concentrated solution must be diluted for use.<sup>(1-10/04)</sup> (4)

*pH* — Potassium phosphates injection is stated to have a pH of approximately 7 to 7.8.<sup>(4)</sup> However, some products cite a pH range of 6.2 to 6.8.<sup>(1-10/04)</sup>

*Osmolarity* — The osmolarity is 7.4 mOsm/mL.<sup>(1-10/04)</sup>

**Administration** — Potassium phosphates injection is administered slowly intravenously diluted in infusion solutions.<sup>(4)</sup>

The relationship between milliequivalents and millimoles of phosphate is expressed in the following equation:

$$(\text{mEq phosphate} = \text{mmol phosphate} \times \text{valence})$$

However, the average valence of phosphate changes with changes in pH. Consequently, it is necessary to specify a pH before the valence, and therefore the milliequivalents, can be determined. To avoid this problem, it has been suggested that doses of phosphate be expressed in terms of millimoles, which is independent of valence.<sup>(178)</sup> (716) (717) (718) Alternatively, the dose may be expressed in terms of milligrams of phosphorus. One millimole of phosphorus equals 31 mg.<sup>(205)</sup> (717)

**Stability** — Potassium phosphates injection should be stored at controlled room temperature. The solutions should be clear and free of particulate matter. Unused portions should be discarded.<sup>(1-10/04)</sup>

<sup>e</sup>Tested in Ringer's injection, lactated.

### **Additional Compatibility Information**

#### **Calcium and Phosphate — UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.**

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented<sup>(1771) (1777)</sup>, but the information is complex and difficult to apply to the clinical situation.<sup>(1770) (1772) (1777)</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that is present which has led to substantial debate on the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>(1770) (1771) (1772) (2031) (2032) (2033) (2034) (2035) (2036)</sup> Because such precipitation may be life-threatening to patients<sup>(2037) (2291)</sup>, the Food and Drug Administration issued a Safety Alert containing the following recommendations<sup>(1769)</sup> :

1. The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a three-in-one admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a two-in-one admixture with the lipid infused separately, or (2) if a three-in-one admixture is medically necessary, then add the calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or

all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

4. During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.
5. A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu\text{m}$  air-eliminating filter for lipid-containing admixtures and a 0.22- $\mu\text{m}$  air-eliminating filter for non-lipid-containing admixtures.

6. Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

7. If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance."

*Calcium Phosphate Precipitation Fatalities* — Fatal cases of paroxysmal respiratory failure in two previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures. <sup>(2037)</sup>

In a follow-up retrospective review, five patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these five patients died, although the cause of death could be definitively determined for only two. <sup>(2291)</sup>

*Calcium and Phosphate Conditional Compatibility* — Calcium salts are conditionally compatible with phosphate in parenteral nutrition solutions. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acids solutions inherently contain calcium and phosphate, which must be

considered in any projection of compatibility.

The compatibility of calcium and phosphate in several parenteral nutrition formulas for newborn infants was evaluated. Calcium gluconate 10% (Cutter) and potassium phosphate (Abbott) were used to achieve concentrations of 2.5 to 100 mEq/L of calcium and 2.5 to 100 mmol/L of phosphorus added. The parenteral nutrition solutions evaluated were as shown in Table 1. The results were reported as graphic depictions.

**Table 1. Parenteral Nutrition Solutions Evaluated**<sup>(609)</sup>

Component	Solution Number			
	#1	#2	#3	#4
FreAmine III	4%	2%	1%	1%
Dextrose	25%	20%	10%	10%
pH	6.3	6.4	6.6	7.0 <sup>a</sup>

<sup>a</sup>Adjusted with sodium hydroxide.

The pH dependence of the phosphate-calcium precipitation has been noted. Dibasic calcium phosphate is very insoluble, while monobasic calcium phosphate is relatively soluble. At low pH, the soluble monobasic form predominates; but as the pH increases, more dibasic phosphate becomes available to bind with calcium and precipitate. Therefore, the lower the pH of the parenteral nutrition solution, the more calcium and phosphate can be solubilized. Once again, the effects of temperature were observed. As the temperature is increased, more calcium ion becomes available and more dibasic calcium phosphate is formed. Therefore, temperature increases will increase the amount of precipitate.<sup>(609)</sup>

Similar calcium and phosphate solubility curves were reported for neonatal parenteral nutrition solutions using TrophAmine (McGaw) 2, 1.5, and 0.8% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment being used in some admixtures. Calcium and phosphate solubility followed the patterns reported previously.<sup>(609)</sup> A slightly greater concentration of phosphate could be used in some mixtures, but this finding was not consistent.<sup>(1024)</sup>

Using a similar study design, six neonatal parenteral nutrition solutions based on Aminosyn-PF (Abbott) 2, 1.5, and 0.8%, with and without added cysteine hydrochloride and dextrose 10% were studied. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 2.5 to 50 mmol/L. Solutions sat for 18 hours at 25 °C and then were warmed to 37 °C in a water bath to simulate the clinical situation of warming prior to infusion into a child. Solubility curves were markedly different than those for TrophAmine in the previous study.<sup>(1024)</sup> Solubilities were reported to decrease by 15 mEq/L for calcium and 15 mmol/L for phosphate. The solutions remained clear during room temperature storage, but crystals often formed on warming to 37 °C.<sup>(1211)</sup>

However, these data were questioned. The similarities between the Aminosyn-PF and TrophAmine products were noted, and little difference was found in calcium and phosphate solubilities in a preliminary report.<sup>(1212)</sup> In the full report<sup>(1213)</sup>, parenteral nutrition solutions containing Aminosyn-PF or TrophAmine 1 or 2.5% with dextrose 10 or 25%, respectively, plus electrolytes and trace metals, with or without cysteine hydrochloride, were evaluated under the same conditions. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 5 to 50 mmol/L. In contrast to the previous results<sup>(1024)</sup>, the solubility curves were very similar for the Aminosyn-PF and TrophAmine parenteral nutrition solutions but very different from those of the previous Aminosyn-PF study.<sup>(1211)</sup> The authors again showed that the solubility of calcium and phosphate is greater in solutions containing higher concentrations of amino acids and dextrose.<sup>(1213)</sup>

Calcium and phosphate solubility curves for TrophAmine 1 and 2% with dextrose 10% and electrolytes, vitamins, heparin, and trace elements were reported. Calcium concentrations ranged from 10 to 60 mEq/L, and phosphorus concentrations ranged from 10 to 40 mmol/L. Calcium and phosphate solubilities were assessed by analysis of the calcium concentrations and followed patterns

similar to those reported previously.<sup>(608)</sup> <sup>(609)</sup> The higher percentage of amino acids (TrophAmine 2%) permitted a slightly greater solubility of calcium and phosphate, especially in the 10 to 50-mEq/L and 10 to 35-mmol/L ranges, respectively.<sup>(1614)</sup>

The maximal product of the amount of calcium (as gluconate) times phosphate (as potassium) that can be added to a parenteral nutrition solution, composed of amino acids 1% (Travenol) and dextrose 10%, for preterm infants was reported. Turbidity was observed on initial mixing when the solubility product was around 115 to 130 mmol<sup>2</sup> or greater. After storage at 7 °C for 20 hours, visible precipitates formed at solubility products of 130 mmol<sup>2</sup> or greater. If the solution was administered through a barium-impregnated silicone rubber catheter, crystalline precipitates obstructed the catheters in 12 hours at a solubility product of 100 mmol<sup>2</sup> and in 10 days at 79 mmol<sup>2</sup>, much lower than the in vitro results.<sup>(1041)</sup>

The solubility of calcium and phosphorus in neonatal parenteral nutrition solutions composed of amino acids (Abbott) 1.25 and 2.5% with dextrose 5 and 10%, respectively, was evaluated. Also present were multivitamins and trace elements. The solutions contained calcium (as gluconate) in amounts ranging from 25 to 200 mg/100 mL. The phosphorus (as potassium phosphate) concentrations evaluated ranged from 25 to 150 mg/100 mL. If calcium gluconate was added first, cloudiness occurred immediately. If potassium phosphate was added first, substantial quantities could be added with no precipitate formation in 48 hours at 4 °C (Table 2). However, if stored at 22 °C, the solutions were stable for only 24 hours, and all contained precipitates after 48 hours.<sup>(1210)</sup>

**Table 2. Maximum Calcium and Phosphorus Concentrations Physically Compatible for 48 Hours at 4 °C<sup>1210</sup>**

Calcium (mg/100 mL)	Phosphorus (mg/100 mL)	
	Amino Acids 1.25% Amino Acids 2.5%	
	+ Dextrose 5% <sup>a</sup>	+ Dextrose 10% <sup>a</sup>
200 <sup>b</sup>	50	75
150	50	100
100	75	100
50	100	125
25	150 <sup>b</sup>	150 <sup>b</sup>

<sup>a</sup>Plus multivitamins and trace elements.

<sup>b</sup>Maximum concentration tested.

The physical compatibility of calcium gluconate 10 to 40 mEq/L and potassium phosphates 10 to 40 mmol/L in three neonatal parenteral nutrition solutions (TPN #123 to #125 in Appendix I), alone and with retrograde administration of aminophylline 7.5 mg diluted with 1.5 mL of sterile water for injection was reported. Contact of the alkaline aminophylline solution with the parenteral nutrition solutions resulted in the precipitation of calcium phosphate at much lower concentrations than were compatible in the parenteral nutrition solutions alone.<sup>(1404)</sup>

Koorenhof and Timmer reported the maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix I). Added calcium was varied from 1.5 to 150 mmol/L, while added phosphate was varied from 21 to 300 mmol/L. The mixtures were stable for 48 hours at 22 and 37 °C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mmol/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup>.<sup>(1773)</sup>

Additional calcium and phosphate solubility curves were reported for specialty parenteral nutrition solutions based on NephroAmine and also HepatoAmine at concentrations of 0.8, 1.5, and 2% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment to simulate addition of fat emulsion used in some admixtures. Calcium and phosphate solubility followed the hyperbolic patterns previously reported.<sup>(609)</sup> Temperature, time, and pH affected calcium and phosphate solubility, with pH having the greatest effect.<sup>(2038)</sup>

The maximum sodium phosphate concentrations were reported for given amounts of calcium gluconate that could be admixed in parenteral nutrition solutions containing TrophAmine in varying quantities (with cysteine hydrochloride 40 mg/g of amino acid) and dextrose 10%. The solutions also contained magnesium sulfate 4 mEq/L, potassium acetate 24 mEq/L, sodium chloride 32 mEq/L, pediatric multivitamins, and trace elements. The presence of cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The admixtures were compounded with the sodium phosphate added last after thorough mixing of all other components. The authors noted that this is not the preferred order of mixing (usually phosphate is added first and thoroughly mixed before adding calcium last); however, they believed this reversed order of mixing would provide a margin of error in cases in which the proper order is not followed. After compounding, the solutions were stored for 24 hours at 40 °C. The maximum calcium and phosphate amounts that could be mixed in the various solutions were reported tabularly and are shown in Table 3.<sup>(2039)</sup> However, these results are not entirely consistent with another study. See Table 4.

**Table 3. Maximum Amount of Phosphate (as Sodium) (mmol/L) Not Resulting in Precipitation.**<sup>2039</sup> See CAUTION below.

Calcium (as Gluconate)	Amino Acid (as TrophAmine) with Cysteine HCl 40 mg/g of Amino Acid				
	0%	0.4%	1%	2%	3%
9.8 mEq/L	0	27	42	60	66
14.7 mEq/L	0	15	18	30	36
19.6 mEq/L	0	6	15	27	30
29.4 mEq/L	0	3	6	21	24

<sup>a</sup>CAUTION: The results cannot be safely extrapolated to other solutions. See text.

The temperature dependence of the calcium-phosphate precipitation has resulted in the occlusion of a subclavian catheter by a solution apparently free of precipitation. The parenteral nutrition solution consisted of FreAmine III 500 mL, dextrose 70% 500 mL, sodium chloride 50 mEq, sodium phosphate 40 mmol, potassium acetate 10 mEq, potassium phosphate 40 mmol, calcium gluconate 10 mEq, magnesium sulfate 10 mEq, and Shil's trace metals solution 1 mL. Although there was no evidence of precipitation in the bottle, tubing and pump cassette, and filter (all at approximately 26 °C) during administration, the occluded catheter and Vicra Loop Lock (next to the patient's body at 37 °C) had numerous crystals identified as calcium phosphate. In vitro, this parenteral nutrition solution had a precipitate in 12 hours at 37 °C but was clear for 24 hours at 26 °C.<sup>(610)</sup>

Similarly, a parenteral nutrition solution that was clear and free of particulates after two weeks under refrigeration developed a precipitate in four to six hours when stored at room temperature. When the solution was warmed in a 37 °C water bath, precipitation occurred in one hour. Administration of the solution before the precipitate was noticed led to interstitial pneumonitis due to deposition of calcium phosphate crystals.<sup>(1427)</sup>

Calcium phosphate precipitation phenomena was evaluated in a series of parenteral nutrition admixtures composed of dextrose 22%, amino acids (FreAmine III) 2.7%, and fat emulsion (Abbott) 0, 1, and 3.2%. Incorporation of calcium gluconate 19 to 24 mEq/L and phosphate (as sodium) 22 to 28 mmol/L resulted in visible precipitation in the fat-free admixtures. New precipitate continued to form over 14 days, even after repeated filtrations of the solutions through 0.2-µm filters. The presence of the amino acids increased calcium and phosphate solubility, compared with simple aqueous solutions. However, the incorporation of the fat emulsion did not result in a statistically significant increase in calcium and phosphate solubility. The authors noted that the kinetics of calcium phosphate precipitate formation do not appear to be entirely predictable; both transient and permanent precipitation can occur either during the compounding process or at some time afterward. Because calcium phosphate precipitation can be very dangerous clinically, the use of inline filters was recommended. The authors suggested that the filters should have a porosity appropriate to the parenteral nutrition admixture-1.2 µm for fat-containing and 0.2 or 0.45 µm for fat-free nutrition mixtures.<sup>(2061)</sup>

Laser particle analysis was used to evaluate the formation of calcium phosphate precipitation in pediatric TPN solutions containing TrophAmine in concentrations ranging from 0.5 to 3% with dextrose 10% and also containing l-cysteine hydrochloride 1 g/L. The solutions also contained in each liter sodium chloride 20 mEq, sodium acetate 20 mEq, magnesium sulfate 3 mEq, trace elements 3 mL, and heparin sodium 500 units. The presence of l-cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The maximum amount of phosphate that was incorporated without the appearance of a measurable increase in particulates in 24 hours at 37 °C for each of the amino acids concentrations is shown in Table 4.<sup>(2196)</sup> These results are not entirely consistent with previous results.<sup>(2039)</sup> See above. The use of more sensitive electronic particle measurement for the formation of subvisible particulates in this study may contribute to the differences in the results.

**Table 4. Maximum Amount of Phosphate (as Potassium) (mmol/L) Not Resulting in Precipitation.**<sup>2196</sup> See CAUTION below.

Calcium (as Gluconate) (mEq/L)	Amino Acid (as TrophAmine) plus Cysteine HCl 1 g/L

45	0	9	9	12	12	12
49	0	9	9	9	12	12
53	0	9	9	9	9	9

<sup>a</sup>CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

Calcium and phosphate compatibility was evaluated in a series of adult formula parenteral nutrition admixtures composed of FreAmine III, in concentrations ranging from 1 to 5% (TPN #258 through #262). The solutions also contained dextrose ranging from 15% up to 25%. Also present were sodium chloride, potassium chloride, and magnesium sulfate in common amounts. Cysteine hydrochloride was added in an amount of 25 mg/g of amino acids from FreAmine III to reduce the pH by about 0.5 pH unit and thereby increase the amount of calcium and phosphates that can be added to the TPN admixtures as has been done with pediatric parenteral nutrition admixtures. Phosphates as the potassium salts and calcium as the gluconate salt were added in variable quantities to determine the maximum amounts of calcium and phosphates that could be added to the test admixtures. The samples were evaluated at 23 and 37 °C over 48 hours by visual inspection in ambient light and using a Tyndall beam and electronic measurement of turbidity and microparticulates. The addition of the cysteine hydrochloride resulted in an increase of calcium and phosphates solubility of about 30% by lowering the solution pH 0.5 pH unit. The boundaries between the compatible and incompatible concentrations were presented graphically as hyperbolic curves.<sup>(2469)</sup>

The presence of magnesium in solutions may also influence the reaction between calcium and phosphate, including the nature and extent of precipitation.<sup>(158) (159)</sup>

The interaction of calcium and phosphate in parenteral nutrition solutions is a complex phenomenon. Various factors have been identified as playing a role in the solubility or precipitation of a given combination, including<sup>(608) (609) (1042) (1063) (1404) (1427) (2778)</sup> :

1. Concentration of calcium
2. Salt form of calcium
3. Concentration of phosphate
4. Concentration of amino acids
5. Amino acids composition
6. Concentration of dextrose
7. Temperature of solution
8. pH of solution
9. Presence of other additives
10. Order of mixing

Enhanced precipitate formation would be expected from such factors as high concentrations of calcium and phosphate, increases in solution pH, decreased amino acid concentrations, increases in temperature, addition of calcium prior to the phosphate, lengthy standing times or slow infusion rates, and use of calcium as the chloride salt. <sup>(854)</sup>

Even if precipitation does not occur in the container, it has been reported that crystallization of calcium phosphate may occur in a Silastic infusion pump chamber or tubing if the rate of administration is slow, as for premature infants. Water vapor may be transmitted outward and be replaced by air rapidly enough to produce supersaturation. <sup>(202)</sup> Several other cases of catheter occlusion have been reported. <sup>(610)</sup> <sup>(1427)</sup> <sup>(1428)</sup> <sup>(1429)</sup>

Potassium Phosphates - AHFS 40:12

## Pralidoxime Chloride - AHFS 92:12

**Products** — Pralidoxime chloride is available as a dry powder in 1-g vials with sodium hydroxide to adjust pH during manufacturing. Reconstitute with 20 mL of sterile water for injection to yield 50 mg/mL. For intravenous infusion, a concentration of 10 to 20 mg/mL in sodium chloride 0.9% is recommended. For intramuscular injection when intravenous administration is not feasible, reconstitute each vial with 3.3 mL of sterile water for injection to yield 300 mg/mL. <sup>(1-6/08)</sup>

Pralidoxime chloride is also available as 600 mg/2 mL in autoinjectors. Also present in the formulation are benzyl alcohol 20 mg/mL and glycine 11.26 mg/mL in water for injection. <sup>(1-6/08)</sup>

*pH* — Vials- From 3.5 to 4.5. Autoinjectors- From 2.0 to 3.0. <sup>(1-6/08)</sup>

**Administration** — Pralidoxime chloride in vials is given by intravenous infusion at a concentration of 10 to 20 mg/mL in sodium chloride 0.9%. If necessary, the 50-mg/mL reconstituted drug may be given by slow intravenous injection over not less than five minutes. For intramuscular injection when intravenous administration is not feasible, a 300-mg/mL concentration may be used. Pralidoxime chloride in the autoinjectors is intended for intramuscular administration only. <sup>(1-6/08)</sup>

**Stability** — Pralidoxime chloride vials should be stored at controlled room temperature. Autoinjectors should be stored at room temperature and protected from freezing. <sup>(1-6/08)</sup>

Pralidoxime Chloride - AHFS 92:12

## Procainamide Hydrochloride - AHFS 24:04.04.04

**Products** — Procainamide hydrochloride is available in 10-mL vials providing 100 mg/mL or 2-mL vials providing 500 mg/mL. The 100-mg/mL form also contains in each milliliter methylparaben 1 mg and sodium metabisulfite 0.8 mg. The 500-mg/mL form also contains in each milliliter methylparaben 1 mg and sodium metabisulfite 1.8 mg. In both forms, the pH is adjusted with hydrochloric acid and/or sodium hydroxide. <sup>(1-5/06)</sup> (4)

*pH* — From 4 to 6. <sup>(1-5/06)</sup>

**Administration** — Procainamide hydrochloride may be administered by intramuscular or direct intravenous injection or intravenous infusion. Both forms may be diluted prior to intravenous use to facilitate control of the administration rate. The intravenous rate of administration should not exceed 50 mg/min. <sup>(1-5/06)</sup> (4)

**Stability** — Procainamide hydrochloride may be stored at controlled room temperature. <sup>(1-5/06)</sup> (4) However, refrigeration retards oxidation, which causes color formation. The solution is initially colorless but may turn slightly yellow on standing. Injection of air into the vial causes the solution to darken. Solutions darker than a light amber should be discarded. <sup>(4)</sup>

Procainamide hydrochloride forms  $\alpha$ - and  $\beta$ -glucosylamine compounds with dextrose. The reaction proceeds rapidly, with about 10% procainamide loss in dextrose 5% occurring in about five hours and 30% loss in 24 hours at 25 °C. Equilibrium is achieved with about 62% of the procainamide present as glucosylamines. <sup>(1896)</sup> The bioavailability, activity, and metabolic fate of these compounds is not known. <sup>(546)</sup> <sup>(1896)</sup> The  $\alpha$ - and  $\beta$ -glucosylamine compounds that form are reversible <sup>(1422)</sup> <sup>(1896)</sup>, although the extent of reversibility in plasma has been questioned. <sup>(2051)</sup> The rate and extent of complex formation are dependent on the dextrose concentration and the solution pH but are independent of the procainamide hydrochloride concentration. <sup>(1422)</sup> In dextrose concentrations ranging from 1 to 5%, the extent of procainamide complex formation ranged from 6% in two days in dextrose 1% up to 35% <sup>(1422)</sup> to 60% <sup>(1896)</sup> in dextrose 5%. Lowering the pH from the normal 4.5 to 1.4 with 0.01 *N* hydrochloric acid completely prevented complex formation. <sup>(1422)</sup> Similarly, increasing the solution pH to 8 is reported to block complexation. <sup>(1423)</sup> Maximum complex formation occurred at pH 3 to 5 <sup>(1423)</sup> or 4 to 5.2 <sup>(1358)</sup>, the natural pH of procainamide hydrochloride admixtures in dextrose 5%. The clinical importance of this complexation, if any, is uncertain.

*Sorption* — Procainamide hydrochloride was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(536)</sup> <sup>(606)</sup>

Milrinone lactate	WI	350 mcg/mL <sup>a</sup>	SQ	2 and 4 mg/mL <sup>a</sup>	3 to 6% procainamide loss in 1 hr and 10 to 13% in 4 hr at 23 °C. No milrinone loss	1191	I
Nesiritide	SCI	50 mcg/mL <sup>ab</sup>		500 mg/mL	Physically compatible for 4 hr. May be chemically incompatible with nesiritide <sup>d</sup>	2625	?
Potassium chloride	AB	40 mEq/L <sup>e</sup>	SQ	100 mg/mL	Physically compatible for 4 hr at room temperature	534	C
Ranitidine HCl	GL	0.5 mg/mL	BA	4 mg/mL <sup>a</sup>	Physically compatible for 24 hr	1323	C

Remifentanil HCl	GW	0.025 and 0.25 mg/mL <sup>b</sup>	ES	10 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2075</a> C
Sodium nitroprusside	RC	0.3, 1.2, 3 mg/mL <sup>a</sup>	SX	6, 20, 40 mg/mL <sup>b</sup>	Visually compatible for 48 hr at 24 °C protected from light	<a href="#">2357</a> C
Vasopressin	AMR	2 and 4 units/mL <sup>b</sup>	AB	4 mg/mL <sup>b</sup>	Physically compatible with vasopressin pushed through a Y-site over 5 sec	<a href="#">2478</a> C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Nesiritide is incompatible with bisulfite antioxidants used in some drug formulations. The specific formulation of the product to be used should be checked to ensure that no sulfite antioxidants are present.

<sup>e</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

Procainamide Hydrochloride - AHFS 24:04.04.04

## Prochlorperazine Edisylate - AHFS 28:16.08.24

**Products** — Prochlorperazine 5 mg/mL (as edisylate) is available in 2-mL vials and 10-mL multiple-dose vials. Each milliliter of solution also contains sodium biphosphate 5 mg, sodium tartrate 12 mg, sodium saccharin 0.9 mg, and benzyl alcohol 0.75% in water for injection. <sup>(1-2/08)</sup>

*pH* — From 4.2 to 6.2. <sup>(1-2/08)</sup>

**Administration** — Prochlorperazine edisylate may be given intramuscularly deep into the upper outer quadrant of the buttock. It may also be given by direct intravenous injection at a rate not exceeding 5 mg/min. It can be given undiluted or diluted in a compatible diluent. It should not be given as a bolus intravenous injection. <sup>(1-2/08)</sup> <sup>(4)</sup> For intravenous infusion, dilution of 20 mg in a liter of compatible infusion solution is recommended. <sup>(4)</sup> Because the drug causes local irritation, subcutaneous injection is not recommended. <sup>(1-2/08)</sup> <sup>(4)</sup>

**Stability** — Intact containers should be stored at controlled room temperature and protected from temperatures of 40 °C or more and from freezing. Solutions of prochlorperazine edisylate are light sensitive and, therefore, should be protected from light. A slightly yellow solution has not had its concentration altered. However, a markedly discolored solution should be discarded. <sup>(1-2/08)</sup> <sup>(4)</sup>

Dilution of prochlorperazine edisylate to a 1-mg/mL concentration with bacteriostatic sodium chloride 0.9% containing methyl- and propylparabens resulted in a distinctly cloudy solution. This cloudiness did not occur when sodium chloride 0.9% preserved with benzyl alcohol was used for the dilution. <sup>(752)</sup>

*Light Effects* — Prochlorperazine edisylate (Wyeth) 20 mg/L in dextrose 5% exhibited about 20% loss in two hours at room temperature when exposed to light. More rapid and extensive decomposition occurred when sodium chloride 0.9% was used as the diluent. <sup>(2412)</sup>

*Filtration* — Prochlorperazine edisylate (SKF) 5 mg/L in dextrose 5% and sodium chloride 0.9% did not display significant sorption to a 0.45-µm cellulose membrane filter. <sup>(567)</sup>

*Central Venous Catheter* — Prochlorperazine edisylate (SoloPak) 0.5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>f</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>g</sup>Lyophilized formulation tested.

<sup>h</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

Prochlorperazine Edisylate - AHFS 28:16.08.24

## Prochlorperazine Mesylate - AHFS 28:16.08.24

**Products** — Prochlorperazine mesylate injection is available in 1- and 2-mL glass ampuls. Each milliliter of solution contains prochlorperazine mesylate 12.5 mg with sodium sulfite, sodium metabisulfite, sodium chloride, ethanolamine, and water for injection. <sup>(38)</sup> <sup>(115)</sup>

**Trade Name(s)** — Stemetil

**Administration** — Prochlorperazine mesylate injection is given by deep intramuscular injection. <sup>(38)</sup> <sup>(115)</sup>

**Stability** — Intact ampuls should be stored at controlled room temperature and protected from light. Exposure to light results in discoloration. Discolored injection should be discarded. <sup>(38)</sup> <sup>(115)</sup>

Prochlorperazine Mesylate - AHFS 28:16.08.24

## Promethazine Hydrochloride - AHFS 28:24.92

**Products** — Promethazine hydrochloride is available in vials, ampuls, and syringe cartridges in concentrations of 25 and 50 mg/mL. Each milliliter also contains disodium edetate 0.1 mg, calcium chloride 0.04 mg, sodium metabisulfite 0.25 mg, phenol 5 mg, and acetic acid-sodium acetate buffer in water for injection. <sup>(1-12/06)</sup>

*pH* — From 4 to 5.5. <sup>(1-12/06)</sup>

*Osmolality* — The osmolality of promethazine hydrochloride 25 mg/mL was determined to be 291 mOsm/kg. <sup>(1233)</sup>

**Administration** — Promethazine hydrochloride is administered preferably by deep intramuscular injection. It should not be given subcutaneously or intra-arterially. If given by intravenous injection, a concentration not exceeding 25 mg/mL should be given into the tubing of a running infusion solution at a rate not exceeding 25 mg/min. <sup>(1-12/06)</sup> <sup>(4)</sup> Extravasation should be avoided. <sup>(4)</sup> <sup>(2312)</sup>

**Stability** — Store at controlled room temperature and protect from freezing and light. Inspect prior to administration for particulate matter formation and discoloration; discard if particulate matter or discoloration is observed. <sup>(1-12/06)</sup> <sup>(4)</sup> Promethazine hydrochloride exhibits increasing stability with decreasing pH. <sup>(1072)</sup>

*Syringes* — Promethazine hydrochloride 25 mg/mL repackaged in 3-mL amber glass syringes (Hy-Pod) and stored at 25 °C exhibited no changes in pH or appearance over 360 days. A possible reduction in concentration to 95% of initial was noted. <sup>(535)</sup>

*Sorption* — Promethazine hydrochloride (May & Baker) 8 mg/L in sodium chloride 0.9% (Travenol) in PVC bags exhibited only about 5% sorption to the plastic during one week of storage at room temperature (15 to 20 °C). However, when the solution was buffered from its initial pH of 5 to 7.4, approximately 59% of the drug was lost in one week due to sorption. <sup>(536)</sup>

In another study, promethazine hydrochloride (May & Baker) 8 mg/L in sodium chloride 0.9% exhibited a cumulative 22% loss during a seven-hour simulated infusion through an infusion set (Travenol) consisting of a cellulose propionate burette chamber and 170 cm of PVC tubing due to sorption. Both the burette and the tubing contributed to the loss. The extent of sorption was found to be independent of concentration. <sup>(606)</sup>

The drug was also tested as a simulated infusion over at least one hour by a syringe pump system. A glass syringe on a syringe pump was fitted with 20 cm of polyethylene tubing or 50 cm of Silastic tubing. Only 5% of the drug was lost with the polyethylene tubing, but a cumulative loss of 72% occurred during the one-hour infusion through the Silastic tubing. <sup>(606)</sup>

A 25-mL aliquot of promethazine hydrochloride (May & Baker) 8 mg/L in sodium chloride 0.9% was stored in all-plastic syringes composed of polypropylene barrels and polyethylene plungers for 24 hours at room temperature in the dark. No loss due to sorption occurred. <sup>(606)</sup>

*Central Venous Catheter* — Promethazine hydrochloride (Schein) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>e</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>f</sup>Tested in dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>g</sup>Tested in dextrose 5% in Ringer's injection.

<sup>h</sup>Tested in Ringer's injection, lactated.

<sup>i</sup>Lyophilized formulation tested.

<sup>j</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

---

### **Additional Compatibility Information**

*Chlorpromazine and Meperidine* — Chlorpromazine hydrochloride, meperidine hydrochloride, and promethazine hydrochloride combined as an extemporaneous mixture for preoperative sedation, developed a brownish-yellow color after two weeks of storage with protection from light. The discoloration was attributed to the metacresol preservative content of the meperidine hydrochloride product used. Use of meperidine hydrochloride which contains a different preservative resulted in a solution that remained clear and colorless for at least three months when protected from light. <sup>(1148)</sup>

Promethazine Hydrochloride - AHFS 28:24.92

## Propofol - AHFS 28:04.92

**Products** — Propofol (Diprivan) 1% is available as a ready-to-use oil-in-water emulsion in 20-mL ampuls and 50- and 100-mL infusion vials. Each milliliter contains propofol 10 mg along with soybean oil 100 mg, glycerol 22.5 mg, egg lecithin 12 mg, and disodium edetate 0.005% with sodium hydroxide to adjust the pH. [\(1-6/08\)](#)

Generic propofol 1% formulations are also available as ready-to-use oil-in-water emulsion in 20-mL vials and 50- and 100-mL infusion vials. However, the products differ from the Diprivan formulation. Each milliliter contains propofol 10 mg along with soybean oil 100 mg, glycerol 22.5 mg, and egg yolk phospholipid 12 mg, but incorporates sodium metabisulfite 0.25 mg or benzyl alcohol 1 mg/mL. Sodium hydroxide is used to adjust the pH during manufacture. [\(1-6/08\)](#)

The propofol products are not identical. Diprivan utilizes disodium edetate as an antimicrobial agent; the generic products utilize sodium metabisulfite or benzyl alcohol for this purpose. Diprivan and the generic propofol with benzyl alcohol have pH values in the range of 7 to 8.5. For the sodium metabisulfite in the propofol formulations to be comparable to the other two formulations as an antimicrobial agent, the pH of the products has been adjusted to 4.5 to 6.4 during manufacture. [\(2348\)](#) [\(2349\)](#)

NOTE: Most of the compatibility information for propofol with other drugs has been developed using Diprivan and cannot be automatically extrapolated to the other products because of the formulation differences. The formulation differences have been demonstrated to result in some differing compatibilities with other drugs. [\(2336\)](#)

*pH* — Diprivan and the benzyl alcohol-containing formulation have a pH in the range of 7 to 8.5. The metabisulfite-containing formulation has a pH of 4.5 to 6.6. [\(1-6/08\)](#)

*Tonicity* — Propofol 1% injectable emulsion is isotonic. [\(1-6/08\)](#)

*Trade Name(s)* — Diprivan

**Administration** — Before use, propofol should be shaken well. It may be administered undiluted by intravenous injection or infusion or diluted with dextrose 5% to no less than 2 mg/mL. [\(1-6/08\)](#)

Numerous outbreaks of serious postoperative infections have resulted from inadvertent contamination of propofol. The contamination resulted from risky preparation practices and lapses in aseptic technique. The lipid base supports microbiological growth. [\(1-6/08\)](#) [\(1930\)](#) The disodium edetate, sodium metabisulfite, or benzyl alcohol in the formulations retard the growth of microorganisms, but the products can still support growth and are not antimicrobially preserved. Strict aseptic procedures are required during preparation. [\(1-6/08\)](#)

**Stability** — Propofol 1% injection is a white, oil-in-water emulsion. Intact containers should be stored between 4 and 22 °C and protected from freezing. The emulsion should not be used if phase separation is evident. [\(1-6/08\)](#)

Propofol undergoes oxidative degradation when exposed to oxygen. Intact containers are packaged using nitrogen to avoid oxygen exposure. If propofol is administered directly from the vial, administration should be completed within 12 hours after the vial is spiked. The tubing and any unused propofol should be discarded after 12 hours. [\(1-6/08\)](#)

Propofol formulated with sodium metabisulfite antioxidant is subject to a differing decomposition reaction compared to the edetate-containing Diprivan. Exposure to air results in the formation of a yellow discoloration in about six to seven hours, which does not occur with Diprivan. The yellow discoloration is a result of the formation of oxidized propofol dimer quinone from sulfite radicals that

form in the generic product and may be associated with increased adverse effects. This oxidation product does not form in Diprivan with EDTA. <sup>(2344)</sup> <sup>(2575)</sup> <sup>(2576)</sup> Stability information developed for the Diprivan formulation should not be extrapolated to the sodium metabisulfite-containing generic formulation. <sup>(2344)</sup>

The physical stability of Diprivan and propofol with sodium metabisulfite was evaluated. The formulation differences, principally pH, resulted in a much higher zeta potential for Diprivan, making it a more rugged emulsion and less subject to damage from physical agitation and thermal insult. Physical agitation resulted in no increase in fat droplet size in Diprivan after 16 hours, but a substantial increase in fat droplets larger than 5 µm occurred in as little as four hours in the generic formulation. <sup>(2445)</sup>

The benzyl alcohol-containing form of propofol has the same pH as Diprivan (pH 7 to 8.5) and exhibits the same degree of ruggedness and resistance to emulsion disruption. <sup>(2659)</sup>

In another study, Diprivan was again reported to be a more rugged emulsion than the generic form with sodium metabisulfite. Diprivan had a very low quantity of fat globules exceeding 5 µm throughout its shelf life. The generic formulation formed much greater amounts of globules of 5 µm and larger within a few months after manufacture and well before the expiration date. This 5-µm globule size and larger is an important threshold because this size globule may occlude capillaries and lead to embolic syndrome. The safety of using the generic formulation of propofol was questioned, especially as the product nears its expiration date. <sup>(2589)</sup>

If propofol emulsion is transferred to a syringe or other container prior to use, administration should be begun promptly and completed within six hours after the container is opened. After six hours, the product should be discarded and the lines should be flushed or discarded. <sup>(1-6/08)</sup>

Propofol emulsion is a single-use product and can support the growth of microorganisms. <sup>(1-6/08)</sup> <sup>(1930)</sup> Propofol strongly supports the growth of *Escherichia coli* and *Candida albicans*. <sup>(2411)</sup> Strict adherence to proper aseptic procedures, including wiping of the ampul neck or vial stopper with isopropanol 70%, is required <sup>(1-6/08)</sup> and discarding after six hours has been recommended. <sup>(2411)</sup>

*Plastic and Glass Containers* — Diluted in dextrose 5%, propofol has been shown to be more stable in glass than in plastic containers. The manufacturers indicate that only 95% remains after only two hours in plastic. However, the type of plastic container subject to this increased rate of loss is not specified. <sup>(1-6/08)</sup>

*Syringes* — Propofol (Diprivan) 10 mg/mL was repackaged into 60-mL polypropylene syringes (Monoject, Sherwood Medical) and stored at 23 °C under fluorescent light and at 4 °C protected from light. No visually apparent changes occurred to the emulsion under either storage condition. Propofol losses were 7% in five days and 12% in seven days in the room-temperature samples. No propofol losses occurred in 13 days in the refrigerated samples. <sup>(1984)</sup>

Propofol (Diprivan) 1% was repackaged into 2- and 10-mL Plastipak (Becton Dickinson) and 2-mL Inject (B. Braun) plastic syringes and was stored at 5 °C. Propofol losses were about 7 to 8% in the Plastipak syringes and about 2% in the Inject syringes after 28 days of refrigerated storage. <sup>(2118)</sup>

*Sorption* — Diprivan injection was diluted to 2 mg/mL with dextrose 5% and stored in PVC tubing (Kendall-McGaw). A propofol loss exceeding 31% occurred after static storage for two hours. In simulated infusions using the same initial concentration, administration through 72-inch PVC administration sets at a rate of 1.75 mL/min resulted in an average propofol loss of 7.7% over the two-hour period. <sup>(2057)</sup>

When tested undiluted at 10 mg/mL, propofol (Diprivan) sorption to administration tubing composed principally of PVC did not represent a substantial portion of the total amount of drug delivered. Any losses that did occur were within the error of the method and were not clinically relevant. <sup>(2297)</sup>

Propofol (Diprivan) was delivered at rates of 1 and 10 mL/hr through PVC tubing. Little loss occurred at the higher rate of delivery. However, at the slower rate, up to 6% propofol loss due to sorption occurred. <sup>(2468)</sup>

**Plasticizer Leaching** — As happens with other surfactant-containing drug formulations, propofol emulsion also has been shown to leach diethylhexyl phthalate (DEHP) plasticizer from PVC equipment such as administration sets. Non-PVC administration sets should be used to deliver this drug. <sup>(2424)</sup>

**Filtration** — The manufacturers recommend that filters with a pore size less than 5 µm should not be used with propofol emulsion. These filters may restrict its administration and/or cause the breakdown of the emulsion. <sup>(1-6/08)</sup> Propofol (Diprivan) 1% 10 mL filtered through a 5-µm filter needle (Burrton Medical) underwent no loss. <sup>(2057)</sup>

Opening propofol packaged in glass ampuls has been shown to yield a substantially higher amount of larger particulates compared to the vials. The larger particulates are probably glass shards associated with opening the ampuls. Drawing the propofol into a syringe using a 5-µm filter significantly reduced the amount of these particles in the product. <sup>(2311)</sup>

## Compatibility Information

### Solution Compatibility

#### Propofol

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in Ringer's injection, lactated				Compatible	<a href="#">1(6/08)</a>	C
Dextrose 5% in sodium chloride 0.225%				Compatible	<a href="#">1(6/08)</a>	C
Dextrose 5% in sodium chloride 0.45%				Compatible	<a href="#">1(6/08)</a>	C
Dextrose 5%				Compatible	<a href="#">1(6/08)</a>	C

Propofol - AHFS 28:04.92

## Propranolol Hydrochloride - AHFS 24:24

**Products** — Propranolol hydrochloride is available in 1-mL ampuls containing 1 mg of the drug with citric acid to adjust the pH in water for injection. <sup>(1-9/06)</sup>

*pH* — From 2.8 to 4. <sup>(1-9/06)</sup>

*Osmolality* — The osmolality of propranolol hydrochloride 1 mg/mL was determined to be 12 mOsm/kg. <sup>(1233)</sup>

*Trade Name(s)* — Inderal

**Administration** — Propranolol hydrochloride is administered by intravenous injection at a rate not exceeding 1 mg/min for life-threatening arrhythmias or those occurring during anesthesia. <sup>(1-9/06)</sup> (4)

**Stability** — Propranolol hydrochloride should be stored at controlled room temperature around 25 °C and protected from light, freezing, or excessive heat. <sup>(1-9/06)</sup> (4) Solutions of the drug have maximum stability at pH 3 and decompose rapidly at alkaline pH. Decomposition in aqueous solutions is accompanied by a lowered pH and discoloration. Solutions fluoresce at pH 4 to 5. <sup>(4)</sup>

*Sorption* — Propranolol hydrochloride was shown not to exhibit sorption to PVC bags and tubing, polyolefin containers, polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(536)</sup> (606) (746)

Propranolol Hydrochloride - AHFS 24:24

## Protamine Sulfate - AHFS 20:28.08

**Products** — Protamine sulfate is available in 5- and 25-mL vials. Each milliliter contains protamine sulfate 10 mg with sodium chloride 0.9% and sodium phosphate and/or sulfuric acid to adjust the pH. <sup>(1-1/08)</sup>

*pH* — From 6 to 7. <sup>(1-1/08)</sup>

*Osmolality* — The osmolality of protamine sulfate 10 mg/mL was determined to be 290 mOsm/kg by freezing-point depression and 292 mOsm/kg by vapor pressure. <sup>(1071)</sup>

**Administration** — Protamine sulfate 10 mg/mL is administered by slow intravenous injection undiluted. No more than 50 mg should be administered in any 10-minute period. It has also been given by intravenous infusion after dilution in sodium chloride 0.9% or dextrose 5%. <sup>(1-1/08)</sup> (4)

**Stability** — Protamine sulfate should be stored under refrigeration; freezing should be avoided. <sup>(1-1/08)</sup> However, protamine sulfate has been stated to be stable for 10 days <sup>(1433)</sup> to two weeks <sup>(853)</sup> at room temperature.

Protamine sulfate is incompatible with some antibiotics including cephalosporins and penicillins. <sup>(1-1/08)</sup>

*Filtration* — Protamine sulfate (Fournier Freres) 0.2 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-HP, Millipore) over six hours. No significant drug loss due to binding to the filter was noted. <sup>(1034)</sup>

Protamine Sulfate - AHFS 20:28.08

## Pyridoxine Hydrochloride - AHFS 88:08

**Products** — Pyridoxine hydrochloride 100 mg/mL is available in 1-, 10-, and 30-mL multiple-dose vials. Antimicrobial preservatives, such as benzyl alcohol 1.5% or chlorobutanol 0.5%, may also be present. Sodium hydroxide and/or hydrochloric acid may have been used to adjust pH. <sup>(1-6/06)</sup> (4)

*pH* — From 2 to 3.8. <sup>(1-6/06)</sup> (4)

*Osmolality* — The osmolality of pyridoxine hydrochloride 100 mg/mL was determined to be 870 mOsm/kg by freezing-point depression and 852 mOsm/kg by vapor pressure. <sup>(1071)</sup>

**Administration** — Pyridoxine hydrochloride may be administered by intramuscular, subcutaneous, or intravenous injection. <sup>(4)</sup>

**Stability** — The product should be stored at controlled room temperature and protected from freezing and from light. <sup>(1-6/06)</sup> (4)

Because pyridoxine hydrochloride is photosensitive and degrades slowly when exposed to light, protection from light has been recommended. <sup>(4)</sup>

*Syringes* — Pyridoxine hydrochloride 100 mg/mL was stable for six months at room temperature packaged in 5-, 10-, and 20-mL polypropylene syringes (Becton Dickinson). <sup>(2692)</sup>

*Sorption* — Pyridoxine hydrochloride (Sigma) 40 mg/L did not display significant sorption to a PVC plastic test strip in 24 hours. <sup>(12)</sup>

### Compatibility Information

#### Drugs in Syringe Compatibility

##### Pyridoxine HCl

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Doxapram HCl	RB	400 mg/20 mL		10 mg/1 mL	Physically compatible with 6% doxapram loss in 24 hr	<a href="#">1177</a>	C

#### Additional Compatibility Information

*Parenteral Nutrition Solutions* — The stability of pyridoxine hydrochloride 15 mg/L was studied in representative parenteral nutrition solutions exposed to fluorescent light, indirect sunlight, and direct sunlight for eight hours. One 5-mL vial of multivitamin concentrate (Lyphomed) containing 15 mg of pyridoxine hydrochloride and also 1 mg of folic acid (Lederle) was added to a liter of parenteral nutrition solution composed of amino acids 4.25%-dextrose 25% (Travenol) with standard electrolytes and trace elements. Pyridoxine hydrochloride was stable over the eight-hour study at room temperature under fluorescent light and indirect sunlight. However, eight hours of exposure to direct sunlight caused an 86% loss of pyridoxine hydrochloride. <sup>(842)</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8 °C for 96 hours with no significant loss of pyridoxine hydrochloride. <sup>(1225)</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the other vitamins, including pyridoxine hydrochloride, retained their initial concentrations. <sup>(2796)</sup>

Pyridoxine Hydrochloride - AHFS 88:08

## Quinidine Gluconate - AHFS 24:04.04.04

**Products** — Quinidine gluconate is available in 10-mL vials. Each milliliter contains 80 mg of drug with edetate disodium 0.005% and phenol 0.25% in water for injection. d-gluconic acid delta-lactone may have been added to adjust the pH. <sup>(1-9/06)</sup>

**Equivalency** — Quinidine gluconate 800 mg is equivalent to 500 mg of anhydrous quinidine. <sup>(1-9/06)</sup>

**pH** — Quinidine gluconate injection has a pH of 5.5 to 7. <sup>(4)</sup>

**Administration** — Quinidine gluconate injection may be given by intermittent or continuous intravenous administration. <sup>(4)</sup> For intravenous administration in treating arrhythmias, 800 mg (10 mL) is diluted with 40 mL of dextrose 5% for a total of 50 mL to yield a 16-mg/mL solution. The drug has also been given by intramuscular injection, but this route is not recommended because of variable absorption. <sup>(1-9/06)</sup> <sup>(4)</sup>

For the treatment of malaria, continuous and intermittent infusion regimens have been used. A loading dose is prepared as a dilution in 250 mL of sodium chloride 0.9% and given as a one- or two-hour (continuous regimen) or four-hour (intermittent regimen) infusion. <sup>(4)</sup>

Infusions of quinidine gluconate must be delivered slowly at a rate no faster than 0.25 mg/kg/min, preferably using a volumetric pump to control the rate of administration. <sup>(1-9/06)</sup>

**Stability** — Quinidine gluconate should be stored at controlled room temperature. <sup>(1-9/06)</sup> Quinidine salts slowly discolor on exposure to light, acquiring a brownish tint. Only clear, colorless solutions are suitable for injection. <sup>(4)</sup>

**Sorption** — A substantial loss of quinidine (as the gluconate) was noted due to sorption to PVC containers and administration sets. Quinidine gluconate 6 mg/mL in dextrose 5% in 100-mL PVC bags (Baxter) exhibited about 5 to 7% loss. Administration of the solution over 30 minutes through 112-inch PVC administration sets (Gemini, IMED) resulted in an additional loss of over 30% of the quinidine gluconate from the delivered solution. Losses totaled over 40% for both bag and catheter. Use of a glass syringe on a syringe pump and a winged administration catheter having only 12 inches of PVC tubing reduced the loss to about 3%. <sup>(2005)</sup>

In two studies, quinidine (as the sulfate) was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(536)</sup> <sup>(606)</sup>

Quinidine Gluconate - AHFS 24:04.04.04

## Quinupristin-Dalfopristin - AHFS 8:12.28.32

**Products** — Quinupristin-dalfopristin is available as a lyophilized powder in vials containing a total of 500 mg of the two pristinamycin derivatives (quinupristin 150 mg and dalfopristin 350 mg) and vials containing 600 mg of the two drugs (quinupristin 180 mg and dalfopristin 420 mg). Reconstitute the 500- and 600-mg vials with 5 and 6 mL, respectively, of sterile water for injection or dextrose 5% and gently swirl (without shaking) to effect dissolution. The reconstituted solution should be allowed to sit for a few minutes until the foam has dissipated and a clear 100-mg/mL solution has formed; this solution must be diluted for administration. <sup>(1-5/08)</sup>

**Trade Name(s)** — Synercid

**Administration** — Quinupristin-dalfopristin is administered by intravenous infusion after suitable dilution in dextrose 5%. For peripheral line administration, the dose should be diluted to about 2 mg/mL in 250 mL of dextrose 5%; for central line administration, 100 mL of diluent may be used. If moderate-to-severe venous irritation occurs during peripheral administration, dilution in 500 or 750 mL should be considered along with changing the infusion site, use of a central catheter, or use of a peripherally inserted central catheter (PICC). The dose is usually administered over 60 minutes. For intermittent infusion of quinupristin-dalfopristin and other drugs through a common line, the manufacturer recommends flushing the line before and after administration with dextrose 5%. <sup>(1-5/08)</sup>

**Stability** — Intact vials of quinupristin-dalfopristin should be stored under refrigeration. <sup>(1-5/08)</sup> Although refrigerated storage is required, the manufacturer has stated the drug may be stored at room temperature for 7 days. <sup>(2745)</sup> Because no antimicrobial preservative is present, the manufacturer recommends dilution of the reconstituted solution within 30 minutes. The drug diluted for infusion in dextrose 5% is stated to be stable for up to five hours at room temperature and 54 hours under refrigeration. It should not be frozen. The use of sodium chloride-containing solutions is not recommended because of incompatibility. <sup>(1-5/08)</sup>

### Compatibility Information

Quinupristin-Dalfopristin - AHFS 8:12.28.32

## Ranitidine Hydrochloride - AHFS 56:28.12

**Products** — Ranitidine hydrochloride 25 mg/mL is available in 2-mL single-dose vials, 6-mL multiple-dose vials, and 40-mL pharmacy bulk packages. Each milliliter of solution also contains phenol 5 mg, dibasic sodium phosphate 2.4 mg, and monobasic sodium phosphate 0.96 mg in water for injection. <sup>(1-2/09)</sup>

Ranitidine hydrochloride is also available at a 1-mg/mL concentration in 50-mL (50 mg) plastic containers premixed in sodium chloride 0.45%. The solution also contains citric acid 15 mg and dibasic sodium phosphate 90 mg as buffers. <sup>(1-2/09)</sup>

**Equivalency** — Ranitidine hydrochloride 168 mg is approximately equivalent to 150 mg of ranitidine. <sup>(4)</sup>

**pH** — From 6.7 to 7.3. <sup>(1-2/09)</sup> (4)

**Osmolality** — The osmolality of ranitidine hydrochloride 10 mg/mL was determined to be 59 mOsm/kg. <sup>(1233)</sup>

The osmolality of ranitidine hydrochloride 1 mg/mL was 260 mOsm/kg in dextrose 5% and 302 mOsm/kg in sodium chloride 0.9%. At 2 mg/mL, the osmolality was 257 mOsm/kg in dextrose 5% and 294 mOsm/kg in sodium chloride 0.9%. <sup>(1375)</sup>

The premixed ranitidine 1-mg/mL solution in sodium chloride 0.45% has an osmolarity of 180 mOsm/L. <sup>(1-2/09)</sup>

**Trade Name(s)** — Zantac

**Administration** — Ranitidine hydrochloride is administered intramuscularly undiluted or slowly intravenously after dilution. For direct intravenous injection, 50 mg is usually diluted to a total of at least 20 mL with a compatible intravenous infusion fluid and given over at least five minutes. For intermittent intravenous infusion, 50 mg may be added to at least 100 mL of intravenous solution and infused over 15 to 20 minutes. For continuous intravenous infusion, 150 mg of ranitidine hydrochloride may be diluted in 250 mL of intravenous fluid and infused at 6.25 mg/hr for 24 hours. <sup>(1-2/09)</sup> (4)

**Stability** — Ranitidine hydrochloride injection should be stored between 4 and 25 °C and protected from light and excessive heat. Brief exposure to temperatures up to 30 °C will not adversely affect the stability of the injection. <sup>(1-2/09)</sup> (4) However, ranitidine hydrochloride injection is reported to form an unacceptable brown discoloration if stored at 40 °C or higher for several months. <sup>(2505)</sup> The product is a clear, colorless to yellow solution. Slight darkening does not indicate concentration change. <sup>(1-2/09)</sup> (4)

Ranitidine hydrochloride was diluted to a concentration of 2.5 mg/mL with bacteriostatic water for injection and repackaged in 30-mL glass vials and 10-mL polypropylene syringes (Becton Dickinson). The vials and syringes were stored at 4 °C for 91 days. Approximately 5 to 6% loss occurred after 91 days of storage under refrigeration. Freshly prepared syringes and syringes stored at 4 °C for 91 days were also stored at 22 °C for 72 hours. No loss was found in the freshly prepared syringes, and about 2% additional loss was found in syringes stored under refrigeration for 91 days. <sup>(1965)</sup>

**Freezing Solutions** — Ranitidine hydrochloride (Glaxo) 0.5, 1, and 2 mg/mL in dextrose 5% and sodium chloride 0.9% in PVC bags showed no change in appearance or concentration when frozen for 30 days at -30 °C. An additional 14 days of refrigerated storage at 4 °C for these previously frozen solutions also resulted in no loss. <sup>(1143)</sup>

At a concentration of 2 mg/mL in dextrose 5% and sodium chloride 0.9% in PVC containers, no change in appearance or drug loss occurred after 100 days of storage at -30 °C. [\(1143\)](#)

The stability of ranitidine hydrochloride (Glaxo) 0.5, 1, and 2 mg/mL in several infusion fluids frozen at -20 °C for 60 days followed by seven days at 23 °C or 14 days at 4 °C was studied. In dextrose 5% in sodium chloride 0.45%, dextrose 5%, dextrose 10%, and sodium chloride 0.9%, ranitidine was physically compatible and chemically stable, retaining more than 90% of the initial concentration under these storage conditions. However, in dextrose 5% in Ringer's injection, lactated, the thawed solutions were slightly yellow with ranitidine hydrochloride losses of 25, 16, and 9% at 0.5, 1, and 2 mg/mL, respectively. [\(1516\)](#)

Ranitidine hydrochloride (Glaxo) 1.5 mg/mL in dextrose 5% or in sodium chloride 0.9% was packaged in PVC infusion pump reservoirs. The reservoirs were stored at -20 °C for 30 days. The frozen solutions were then thawed by storing at 3 °C for 24 hours followed by 24 hours at 30 °C to simulate use conditions. No loss was found. [\(1865\)](#)

**Filtration** — Filtration of ranitidine hydrochloride (Glaxo) 0.25, 0.5, and 2.5 mg/mL in sodium chloride 0.9% through 0.2-µm polysulfone filters (IVS Set-P Supor Filter, Codan) at a rate of 4 mL/hr for five hours did not result in any loss of drug due to sorption to the filter. [\(2229\)](#)

**Central Venous Catheter** — Ranitidine hydrochloride (Glaxo Wellcome) 0.2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. [\(2335\)](#)

Sodium chloride 0.9%	BRN <sup>b</sup>	GW	250 mg	Visually compatible. 5% or less loss in 24 hr at 4 and 22 °C	<a href="#">2289</a>	C

TNA #92 <sup>d</sup>	c	GL	50 and 100 mg	7 to 10% ranitidine loss in 12 hr and 20 to 28% loss in 24 hr at 23 °C in light	<a href="#">1183</a>	I
TNA #118 <sup>d</sup>		GL	50 and 100 mg	Physically compatible. 6 to 10% ranitidine loss in 36 hr under refrigeration and at 25 °C	<a href="#">1360</a>	C
TNA #197 to #200 <sup>d</sup>		GL	75 mg	Physically compatible with 7% or less ranitidine loss in 24 hr at 22 °C in light. About 15% loss in 48 hr	<a href="#">1921</a>	C
TNA #245 <sup>d</sup>			200 mg	No ranitidine loss and no lipid change in 24 hr at room temperature	<a href="#">486</a>	C
TNA #246 <sup>d</sup>		GL	72 mg	Less than 7% ranitidine loss and no change in emulsion integrity in 14 days at 4 °C	<a href="#">501</a>	C
TPN #58 <sup>d</sup>		GL	83, 167, 250 mg	10% ranitidine loss in 48 hr at 23 °C	<a href="#">997</a>	C
TPN #59, #60 <sup>d</sup>	a	GL	50 and 100 mg	No color change and 7 to 9% ranitidine loss in 24 hr at 24 °C in light. Amino acids unaffected. Darkened color and 10 to 12% ranitidine loss in 48 hr	<a href="#">1010</a>	C
TPN #117 <sup>d</sup>		GL	50 and 100 mg	Physically compatible and 5% ranitidine loss in 48 hr refrigerated and at 25 °C	<a href="#">1360</a>	C
TPN #196 <sup>d</sup>		GL	75 mg	Physically compatible with 7% or less ranitidine loss in 24 hr at 22 °C in light. About 12% loss in 48 hr	<a href="#">1921</a>	C
TPN #247 <sup>d</sup>		GL	72 mg	2% ranitidine loss in 14 days at 4 °C	<a href="#">501</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polyethylene and glass containers.

<sup>c</sup>Tested in ethylene vinyl acetate containers.

<sup>d</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

### Additive Compatibility

#### Ranitidine HCl

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Acetazolamide sodium		5 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Acetazolamide not tested	<a href="#">1515</a>	C
Amikacin sulfate	BR	1 g	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	<a href="#">1151</a>	C
Amikacin sulfate		2.5 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Amikacin not tested	<a href="#">1515</a>	C

Aminophylline	ES	500 mg and 2 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Physically compatible. 4% or less ranitidine loss in 24 hr at room temperature in light. Aminophylline not tested	<a href="#">1361</a> C
Aminophylline	ES	0.5 and 2 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Visually compatible. Little loss of either drug in 48 hr at room temperature	<a href="#">1802</a> C
Amphotericin B	SQ	200 mg	GL	100 mg	D5W	Color change and particle formation	<a href="#">1151</a> I
Ampicillin sodium		2 g	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature under fluorescent light. Ampicillin instability is determining factor	<a href="#">1151</a> ?
Ampicillin sodium		1 g	GL	50 mg and 2 g	NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Ampicillin not tested	<a href="#">1515</a> C
Atracurium besylate	BW	500 mg		500 mg	D5W	Atracurium unstable due to high pH	<a href="#">1694</a> I
Cefazolin sodium		2 g	GL	100 mg	D5W	Color change within 24 hr	<a href="#">1151</a> ?
Cefazolin sodium		1 g	GL	50 mg and 2 g	D5W	Ranitidine stable for only 6 hr at 25 °C. Cefazolin not tested	<a href="#">1515</a> I
Cefoxitin sodium		10 g	GL	50 mg and 2 g	D5W	Ranitidine stable for only 4 hr at 25 °C. Cefoxitin not tested	<a href="#">1515</a> I
Ceftazidime	GL	10 g	GL	500 mg	D2.5(1/2)S	8% ranitidine loss in 4 hr and 37% loss in 24 hr at 22 °C	<a href="#">1632</a> I
Cefuroxime sodium	GL	1.5 g	GL	100 mg	D5W	Color change in 24 hr at ambient temperature in light	<a href="#">1151</a> ?
Cefuroxime sodium		6 g	GL	50 mg and 2 g	D5W	Ranitidine stable for only 6 hr at 25 °C. Cefuroxime not tested	<a href="#">1515</a> I
Chloramphenicol sodium succinate		2 g	GL	100 mg	D5W	Physically compatible for 24 hr at ambient	<a href="#">1151</a> C

Chlorothiazide sodium		5 g	GL	50 mg and 2 g	D5W	temperature Physically compatible. Ranitidine stable for 24 hr at 25 °C. Chlorothiazide not tested	<a href="#">1515</a> C
Ciprofloxacin	BAY	2 g	GL	500 mg and 1 g	NS	Visually compatible. Little ciprofloxacin loss in 24 hr at 25 °C. Ranitidine not tested	<a href="#">1934</a> C
Clindamycin phosphate	UP	1.2 g	GL	100 mg	D5W	Color change and gas formation	<a href="#">1151</a> I
Clindamycin phosphate		1.2 g	GL	50 mg and 2 g	D5W, NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Clindamycin not tested	<a href="#">1515</a> C
Colistimethate sodium		1.5 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Colistimethate not tested	<a href="#">1515</a> C
Dexamethasone sodium phosphate		40 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Dexamethasone not tested	<a href="#">1515</a> C
Digoxin		2.5 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Digoxin not tested	<a href="#">1515</a> C
Dobutamine HCl	LI	250 mg and 1 g	GL	2 g	D5W, NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature in light. Dobutamine not tested	<a href="#">1361</a> C
Dobutamine HCl	LI	250 mg and 1 g	GL	50 mg	D5W <sup>a</sup>	Physically compatible. 7% ranitidine loss in 48 hr at room temperature in light. Dobutamine not tested	<a href="#">1361</a> C
Dobutamine HCl	LI	250 mg and 1 g	GL	50 mg	NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature in	<a href="#">1361</a> C

Dobutamine HCl	LI	0.25 and 1 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	light. Dobutamine not tested Visually compatible. Little loss of either drug in 48 hr at room temperature	<a href="#">1802</a>	C
Dopamine HCl	ES	400 mg and 3.2 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Physically compatible. 6% ranitidine loss in 48 hr at room temperature in light. Dopamine not tested	<a href="#">1361</a>	C
Dopamine HCl	ES	0.4 and 3.2 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Visually compatible. No dopamine and 7% ranitidine loss in 48 hr at room temperature	<a href="#">1802</a>	C
Doxycycline hyclate	PF	200 mg	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	<a href="#">1151</a>	C
Epinephrine HCl		50 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Epinephrine not tested	<a href="#">1515</a>	C
Erythromycin lactobionate		5 g	GL	50 mg and 2 g	NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Erythromycin not tested	<a href="#">1515</a>	C
Ethacrynate sodium		500 mg	GL	50 mg and 2 g	D5W	Ranitidine stable for only 6 hr at 25 °C. Ethacrynate not tested	<a href="#">1515</a>	I
Fat emulsion, intravenous	KV	10%	GL	50 and 100 mg		Physically compatible. 4% or less ranitidine loss in 48 hr at 25 °C in light or dark	<a href="#">1360</a>	C
Floxacin sodium	BE	20 g	GL	500 mg	NS	Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Fluconazole with ondansetron HCl	RR GL	2 g 100 mg	GL	500 mg	<sup>a</sup>	Visually compatible with no loss of any drug in 4 hr	<a href="#">1730</a>	C
Flumazenil	RC	20 mg	GL	300 mg	D5W <sup>a</sup>	Visually compatible. 3% flumazenil loss in 24 hr at 23 °C in light. Ranitidine not	<a href="#">1710</a>	C

Furosemide	HO	1 g	GL	500 mg	NS	tested Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Furosemide		400 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Furosemide not tested	<a href="#">1515</a>	C
Gentamicin sulfate		160 mg	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	<a href="#">1151</a>	C
Gentamicin sulfate		80 mg	GL	50 mg and 2 g	D5W, NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Gentamicin not tested	<a href="#">1515</a>	C
Heparin sodium	ES	10,000 and 40,000 units	GL	2 g	D5W, NS <sup>a</sup>	Physically compatible. 2% ranitidine loss in 48 hr at room temperature in light. Heparin not tested	<a href="#">1361</a>	C
Heparin sodium	ES	10,000 and 40,000 units	GL	50 mg	NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature in light. Heparin not tested	<a href="#">1361</a>	C
Heparin sodium	ES	10,000 and 40,000 units	GL	50 mg	D5W <sup>a</sup>	Physically compatible. 7% ranitidine loss in 24 hr and 12% loss in 48 hr at room temperature in light. Heparin not tested	<a href="#">1361</a>	C
Insulin, regular	LI	1000 units	GL	600 mg	NS <sup>a</sup>	Visually compatible. Little ranitidine loss in 24 hr at ambient temperature but insulin losses of 9% in 4 hr and 14% in 24 hr, presumably due to sorption	<a href="#">2079</a>	I
Isoproterenol HCl		20 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C.	<a href="#">1515</a>	C

Lidocaine HCl	AST	1 and 8 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Isoproterenol not tested Physically compatible. 3% ranitidine loss in 24 hr at room temperature in light. Lidocaine not tested	<a href="#">1361</a>	C
Lidocaine HCl		2.5 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Lidocaine not tested	<a href="#">1515</a>	C
Lidocaine HCl	AST	1 and 8 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Visually compatible. Little loss of either drug in 48 hr at room temperature	<a href="#">1802</a>	C
Lincomycin HCl		2.4 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Lincomycin not tested	<a href="#">1515</a>	C
Meropenem	ZEN	1 and 20 g	GL	100 mg	NS	Visually compatible for 4 hr at room temperature	<a href="#">1994</a>	C
Methylprednisolone sodium succinate	UP	40 mg	GL	50 mg	D5W <sup>a</sup>	Visually compatible with 7% ranitidine loss and no methylprednisolone loss in 48 hr at room temperature	<a href="#">1802</a>	C
Methylprednisolone sodium succinate	UP	2 g	GL	50 mg	D5W <sup>a</sup>	Visually compatible with 6% ranitidine loss and 10% methylprednisolone loss in 48 hr at room temperature	<a href="#">1802</a>	C
Methylprednisolone sodium succinate	UP	40 mg and 2 g	GL	2 g	D5W <sup>a</sup>	Visually compatible with no loss of either drug in 48 hr at room temperature	<a href="#">1802</a>	C
Methylprednisolone sodium succinate	UP	40 mg and 2 g	GL	50 mg and 2 g	NS <sup>a</sup>	Visually compatible with no ranitidine loss and about 10% methylprednisolone loss in 48 hr at room temperature	<a href="#">1802</a>	C
Midazolam HCl	RC	50 and 250 mg	GL	400 mg	NS	Visually compatible for 4 hr	<a href="#">355</a>	C
Norepinephrine bitartrate	WI	4 and 8 mg	GL	50 mg	D5W, NS <sup>a</sup>	Physically compatible. 2 to 6% ranitidine loss	<a href="#">1361</a>	C

Norepinephrine bitartrate		4 mg	GL	50 mg	D5W	in 48 hr at room temperature in light. Norepinephrine not tested	1515	C
Norepinephrine bitartrate	RC	4 and 8 mg	GL	50 mg	D5W <sup>a</sup>	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Norepinephrine not tested	1802	C
Norepinephrine bitartrate	RC	4 mg	GL	2 g	D5W <sup>a</sup>	Visually compatible. 5 to 7% ranitidine loss and little norepinephrine loss in 48 hr at room temperature	1802	I
Norepinephrine bitartrate	RC	8 mg	GL	2 g	D5W <sup>a</sup>	Visually compatible. 7% norepinephrine loss in 4 hr and 13% in 12 hr at room temperature. No ranitidine loss in 48 hr	1802	I
Norepinephrine bitartrate	RC	8 mg	GL	2 g	D5W <sup>a</sup>	Visually compatible. 6% norepinephrine loss in 12 hr and 11% in 24 hr at room temperature. No ranitidine loss in 48 hr	1802	I
Ondansetron HCl with fluconazole	GL RR	100 mg 2 g	GL	500 mg	<sup>a</sup>	Visually compatible with no loss of any drug in 4 hr	1730	C
Penicillin G potassium		24 million units	GL	50 mg and 2 g	D5W, NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Penicillin not tested	1515	C
Penicillin G sodium		2.4 million units	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	1151	C
Phytonadione		100 mg	GL	50 mg and 2 g	D5W	Ranitidine stable for only 6 hr at 25 °C. Phytonadione not tested	1515	I
Polymyxin B sulfate		1 million units	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Polymyxin B not tested	1515	C

Potassium chloride	LY	10 and 60 mEq	GL	2 g	D5W, NS <sup>a</sup>	Physically compatible. 2% ranitidine loss in 48 hr at room temperature in light	<a href="#">1361</a>	C
Potassium chloride	LY	10 and 60 mEq	GL	50 mg	NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature in light	<a href="#">1361</a>	C
Potassium chloride	LY	10 and 60 mEq	GL	50 mg	D5W <sup>a</sup>	Physically compatible. 7% ranitidine loss in 48 hr at room temperature in light	<a href="#">1361</a>	C
Potassium chloride		80 mEq	GL	50 mg and 2 g	D5S, D5W, NS	Physically compatible. Ranitidine stable for 24 hr at 25 °C	<a href="#">1515</a>	C
Protamine sulfate		500 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Protamine not tested	<a href="#">1515</a>	C
Quinidine gluconate		3.2 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Quinidine not tested	<a href="#">1515</a>	C
Sodium nitroprusside	RC	50 and 400 mg	GL	2 g	D5W, NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature light protected. Nitroprusside not tested	<a href="#">1361</a>	C
Sodium nitroprusside	RC	50 and 400 mg	GL	50 mg	NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature light protected. Nitroprusside not tested	<a href="#">1361</a>	C
Sodium nitroprusside	RC	50 and 400 mg	GL	50 mg	D5W <sup>a</sup>	Physically compatible with 7% or less ranitidine loss in 48 hr protected from light. Nitroprusside not tested	<a href="#">1361</a>	C

Sodium nitroprusside		50 mg and 1 g	GL	50 mg and 2 g	D5W, NS	Physically compatible. Both drugs stable for 48 hr at room temperature protected from light	<a href="#">1515</a> C
Sodium nitroprusside		100 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Sodium nitroprusside not tested	<a href="#">1515</a> C
Sodium nitroprusside	RC	50 and 400 mg	GL	50 mg and 2 g	D5W <sup>a</sup>	Visually compatible. 7% ranitidine and 8% nitroprusside loss in 48 hr at room temperature protected from light	<a href="#">1802</a> C
Sodium nitroprusside	RC	50 and 400 mg	GL	50 mg and 2 g	NS <sup>a</sup>	Visually compatible. No loss of either drug in 48 hr at room temperature protected from light	<a href="#">1802</a> C
Tobramycin sulfate	DI	200 mg	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	<a href="#">1151</a> C
Tramadol HCl	GRU	400 mg	AB	0.5 g	NS	Visually compatible with little or no tramadol loss in 24 hr at room temperature	<a href="#">2652</a> C
Vancomycin HCl	DI	1 g	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	<a href="#">1151</a> C
Vancomycin HCl		5 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25 °C. Vancomycin not tested	<a href="#">1515</a> C
Zidovudine	GSK	2 g	GSK	500 mg	NS	Physically compatible with no loss of either drug in 24 hr at 4 and 23 °C	<a href="#">2523</a> C
Zidovudine	GSK	2 g	GSK	500 mg	D5W	Physically compatible. Up to 8% ranitidine loss at 23 °C and 2% at 4 °C in 24 hr.	<a href="#">2523</a> C

Zidovudine losses  
of 5 to 6% in 24 hr  
at 4 and 23 °C

<sup>a</sup>Tested in PVC containers.

### Drugs in Syringe Compatibility

#### Ranitidine HCl

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Atropine sulfate	GL	0.4 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Chlorpromazine HCl	RP	25 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Chlorpromazine HCl	RP	25 mg	GL	50 mg/5 mL	Gas formation	1151	I
Cyclizine lactate	CA	50 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Dexamethasone sodium phosphate	ME	4 mg	GL	50 mg/5 mL	Physically compatible for 4 hr at ambient temperature under fluorescent light	1151	C
Diazepam	RC	10 mg/2 mL	GL	50 mg/2 mL	Immediate white haze that disappears following vortex mixing	978	?
Diazepam		10 mg	GL	50 mg/5 mL	Physically compatible for 4 hr at ambient temperature under fluorescent light	1151	C
Dimenhydrinate	HR	50 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Diphenhydramine HCl	PD	50 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Dobutamine HCl	LI	25 mg	GL	50 mg/5 mL	Physically compatible for 4 hr at ambient temperature under fluorescent light	1151	C
Dopamine HCl		40 mg	GL	50 mg/5 mL	Physically compatible for 4 hr at ambient temperature under fluorescent light	1151	C
Fentanyl citrate	JN	0.1 mg/2 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Glycopyrrolate	RB	0.2 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Heparin sodium		2500 units/1 mL	GL	50 mg/5 mL	Visually compatible for at least 5 min	1053	C
Hydromorphone HCl	PE	2 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Hydroxyzine HCl	PF	50 mg/1 mL	GL	50 mg/2 mL	Immediate white haze that disappears following vortex mixing	978	I
Lorazepam	WY	4 mg/1 mL	GL	50 mg/2 mL	Poor mixing and layering, which disappears following vortex mixing	978	?
Meperidine HCl	WI	100 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	978	C
Methotrimeprazine HCl	RP	25 mg/1 mL	GL	50 mg/2 mL	Immediate white turbidity	978	I

Metoclopramide HCl	RB	10 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Midazolam HCl	RC	5 mg/1 mL	GL	50 mg/2 mL	White precipitate forms immediately	<a href="#">1145</a>	I
Morphine sulfate	AH	10 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Nalbuphine HCl	EN	10 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Pantoprazole sodium	<a href="#">a</a>	4 mg/1 mL		25 mg/1 mL	Possible precipitate within 4 hr	<a href="#">2574</a>	I
Pentazocine lactate	WI	60 mg/2 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Pentobarbital sodium	AB	100 mg	GL	50 mg/5 mL	Precipitates immediately	<a href="#">1151</a>	I
Phenobarbital sodium	AB	120 mg/1 mL	GL	50 mg/2 mL	Immediate white haze	<a href="#">978</a>	I
Prochlorperazine edisylate	RP	10 mg/2 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Promethazine HCl	RP	25 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Promethazine HCl	RP	25 mg	GL	50 mg/5 mL	Physically compatible for 4 hr	<a href="#">1151</a>	C
Scopolamine HBr	AB	0.4 mg/1 mL	GL	50 mg/2 mL	Physically compatible for 1 hr at 25 °C	<a href="#">978</a>	C
Scopolamine HBr		0.5 mg	GL	50 mg/5 mL	Physically compatible for 4 hr at ambient temperature under fluorescent light	<a href="#">1151</a>	C

<sup>a</sup>Test performed using the formulation WITHOUT edetate disodium.

### Y-Site Injection Compatibility (1:1 Mixture)

#### Ranitidine HCl

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Acyclovir sodium	BW	5 mg/mL <sup>a</sup>	GL	1 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 25 °C	<a href="#">1157</a>	C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in sodium chloride 0.45%.

<sup>d</sup>Tested in Ringer's injection, lactated.

<sup>e</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>f</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>g</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>h</sup>Tested in sterile water for injection.

<sup>i</sup>Lyophilized formulation tested.

<sup>j</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>k</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

Ranitidine Hydrochloride - AHFS 56:28.12

## Remifentanil Hydrochloride - AHFS 28:08.08

**Products** — Remifentanil hydrochloride is available in vials containing 1, 2, or 5 mg of remifentanil base present as the hydrochloride. Each vial also contains glycine 15 mg and hydrochloric acid for pH adjustment. The contents of the vials should be reconstituted with 1 mL of compatible diluent per milligram of remifentanil to yield a 1-mg/mL solution. [\(1-9/07\)](#)

*pH* — From 2.5 to 3.5. [\(1-9/07\)](#)

*Trade Name(s)* — Ultiva

**Administration** — Remifentanil hydrochloride is administered intravenously only. Single doses may be given over 30 to 60 seconds. Remifentanil hydrochloride may also be given by continuous intravenous infusion using an infusion device. The manufacturer recommends that the injection site be near the venous cannula and that all tubing be cleared at the time the infusion is discontinued. Bolus doses and continuous infusion should not be administered simultaneously to spontaneously breathing patients. [\(1-9/07\)](#)

For intravenous administration, remifentanil hydrochloride should be diluted to a final concentration of 20, 25, 50, or 250 mcg/mL. It should not be administered without dilution. [\(1-9/07\)](#)

**Stability** — Remifentanil hydrochloride is a white to off-white lyophilized powder that forms a clear, colorless solution upon reconstitution. Intact vials should be stored between 2 and 25 °C. [\(1-9/07\)](#)

### Compatibility Information

#### Solution Compatibility

##### Remifentanil HCl

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5% in Ringer's injection, lactated			20 to 250 mg	Compatible and stable for 24 hr	<a href="#">1(9/07)</a>	C
Dextrose 5% in sodium chloride 0.9%			20 to 250 mg	Compatible and stable for 24 hr	<a href="#">1(9/07)</a>	C
Dextrose 5%			20 to 250 mg	Compatible and stable for 24 hr	<a href="#">1(9/07)</a>	C
Ringer's injection, lactated			20 to 250 mg	Stable for 4 hr	<a href="#">1(9/07)</a>	C
Sodium chloride 0.45%			20 to 250 mg	Compatible and stable for 24 hr	<a href="#">1(9/07)</a>	C
Sodium chloride 0.9%			20 to 250 mg	Compatible and stable for 24 hr	<a href="#">1(9/07)</a>	C

Zidovudine	BW	4 mg/mL <sup>a</sup>	GW	0.025 and 0.25 mg/mL <sup>b</sup>	Physically compatible for 4 hr at 23 °C	<a href="#">2075</a> C

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in sterile water for injection.

<sup>d</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>e</sup>Tested in Ringer's injection, lactated.

<sup>f</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>g</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>h</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

Remifentanil Hydrochloride - AHFS 28:08.08

## Reteplase - AHFS 20:12.20

**Products** — Reteplase is available as a lyophilized powder in 10.4-unit (18.1-mg) vials; the slight overfill is to ensure that 10 units of drug can be delivered. The vials are packaged with sterile water for injection diluent in kits containing two vials of drug and diluent along with syringes, needles, alcohol swabs, and dispensing pins and in half-kits with a single vial of drug and diluent with a dispensing pin. Each vial also contains tranexamic acid 8.32 mg, dipotassium hydrogen phosphate 136.24 mg, phosphoric acid 51.27 mg, sucrose 364 mg, and polysorbate 80 5.2 mg. <sup>(1-11/06)</sup>

Reconstitute the reteplase vials using the diluent and dispensing pin provided. Other solutions should not be used to reconstitute the drug. Swirl gently to dissolve the drug yielding a 1-unit/mL solution. Do not shake. If slight foaming occurs, the vials should be allowed to stand for several minutes to dissipate large bubbles. <sup>(1-11/06)</sup> (4)

*pH* — The reconstituted solution has a pH from 5.7 to 6.3. <sup>(1-11/06)</sup>

*Trade Name(s)* — Retavase

**Administration** — Reteplase is administered intravenously as a double bolus injection, each injection delivered over two minutes. The second injection is given 30 minutes after completion of the first injection. The manufacturer recommends no other drugs be administered in the line used to deliver reteplase. <sup>(1-11/06)</sup>

**Stability** — Intact packages should be stored between 2 and 25 °C. The boxes should stay sealed until use to protect from light. Because no antimicrobial preservatives are present, the manufacturer recommends reconstitution immediately before use. The colorless reconstituted solution may be used for up to four hours after reconstitution when stored between 2 and 30 °C. <sup>(1-11/06)</sup>

Reteplase is incompatible with heparin sodium. If mixed in the same container or run into the same line as heparin sodium, a solid or semisolid mass may form. However, heparin sodium may be administered sequentially with reteplase into the same line used to deliver reteplase if the line is adequately flushed with sodium chloride 0.9% or dextrose 5% both before and after reteplase administration. <sup>(1-11/06)</sup>

## Rifampin - AHFS 8:16.04

**Products** — Rifampin is available as a lyophilized powder in vials containing rifampin 600 mg, sodium formaldehyde sulfoxylate 10 mg, and sodium hydroxide to adjust the pH. Reconstitute with 10 mL of sterile water for injection; swirl gently to dissolve the vial contents for a 60-mg/mL solution. <sup>(1-7/08)</sup>

**Trade Name(s)** — Rifadin I.V.

**Administration** — Rifampin is administered by intravenous infusion. It must not be given intramuscularly or subcutaneously, and extravasation should be avoided. The reconstituted solution may be diluted in 500 mL of dextrose 5% or sodium chloride 0.9% and infused over three hours. Alternatively, the desired dose may be diluted in 100 mL and administered over 30 minutes. <sup>(1-7/08)</sup> <sup>(4)</sup>

**Stability** — Rifampin powder is reddish brown. Intact vials should be stored at room temperature and protected from excessive heat and light. The reconstituted solution is stable for 24 hours at room temperature. <sup>(1-7/08)</sup>

### Compatibility Information

## Rocuronium Bromide - AHFS 12:20.20

**Products** — Rocuronium bromide is available in 5- and 10-mL vials. Each milliliter contains rocuronium bromide 10 mg with sodium acetate 2 mg, sodium chloride for isotonicity, and acetic acid and/or sodium hydroxide to adjust the pH. [\(1-9/08\)](#)

*pH* — Adjusted during manufacture to pH 4. [\(1-9/08\)](#)

*Osmolality* — The injection is isotonic. [\(1-9/08\)](#)

*Trade Name(s)* — Zemuron

**Administration** — Rocuronium bromide is administered intravenously only by rapid intravenous injection or by intravenous infusion when admixed in an appropriate intravenous infusion solution. Infusion rates should be individualized for each patient according to the requirements and response. [\(1-9/08\)](#) (4)

**Stability** — Intact vials of rocuronium bromide should be stored under refrigeration at 2 to 8 °C and protected from freezing. Intact vials stored at room temperature should be used within 60 days. Opened vials should be used within 30 days. [\(1-9/08\)](#)

Rocuronium Bromide - AHFS 12:20.20

## Ropivacaine Hydrochloride - AHFS 72:00

**Products** — Ropivacaine hydrochloride is available in concentrations of 2 mg/mL (0.2%), 5 mg/mL (0.5%), 7.5 mg/mL (0.75%), and 10 mg/mL (1%) along with sodium chloride for isotonicity and sodium hydroxide and/or hydrochloric acid for pH adjustment in water for injection. The products are packaged in single-dose glass vials and in polypropylene plastic ampuls designed to fit Luer-lock and Luer-slip syringes. The 2-mg/mL concentration is also available in 100 and 200-mL infusion bottles. Sterile-Pak products should be selected when a container having a sterile outside is required. <sup>(1-4/06)</sup>

*pH* — From 4 to 6.5. <sup>(404)</sup>

*Tonicity* — Ropivacaine hydrochloride injections are isotonic. <sup>(1-4/06)</sup>

*Specific Gravity* — The specific gravities of ropivacaine hydrochloride injections range from 1.002 to 1.005 at 25 °C. <sup>(1-4/06)</sup>

*Trade Name(s)* — Naropin

**Administration** — Ropivacaine hydrochloride is administered parenterally by lumbar epidural injection or infusion, by thoracic epidural infusion, by injection for nerve block, and by infiltration. <sup>(1-4/06)</sup>

**Stability** — Intact containers of ropivacaine hydrochloride should be stored at controlled room temperature. The single-dose containers have no antimicrobial preservatives. The manufacturer recommends that any remaining solution in an opened container be discarded promptly. The continuous infusion bottles should not be left in place for more than 24 hours. <sup>(1-4/06)</sup>

*Autoclaving* — Ropivacaine hydrochloride in glass containers is stable during one autoclaving to sterilize the container. <sup>(1-4/06)</sup>

*pH Effects* — The solubility of ropivacaine hydrochloride is reduced above pH 6. Consequently, contact with alkaline solutions may result in precipitation. <sup>(1-4/06)</sup>

Ropivacaine Hydrochloride - AHFS 72:00

## Salbutamol - AHFS 12:12.08.12

**Products** — Salbutamol injection is available as a 500-mcg/mL solution in 1-mL ampuls as the sulfate. In addition, the product contains sodium chloride, sodium hydroxide, and sulfuric acid in water for injection. <sup>(38)</sup> <sup>(115)</sup>

Salbutamol infusion is available as a 1-mg/mL solution as the sulfate in 5-mL containers for use in infusions. In addition, the product for infusion also contains sodium chloride, sodium hydroxide, and sulfuric acid in water for injection. This concentrate must be diluted in a suitable intravenous infusion solution for use. <sup>(38)</sup> <sup>(115)</sup>

*pH* — About 3.5. <sup>(115)</sup>

*Tonicity* — Both salbutamol injection and infusion are isotonic. <sup>(38)</sup> <sup>(115)</sup>

*Trade Name(s)* — Salbumol, Ventolin, others.

**Administration** — Salbutamol injection is administered by subcutaneous, intramuscular, or slow intravenous injection. A 50-mcg/mL concentration is suitable for slow intravenous injection; dilution of the 500-mcg/mL concentration with water for injection has been recommended for intravenous injection, <sup>(38)</sup> <sup>(115)</sup> although it is likely to be hypotonic.

Salbutamol 1-mg/mL for intravenous infusion is used to prepare intravenous infusion solutions of the drug. It should not be given undiluted. It should be diluted to a concentration of 10 or 20 mcg/mL with a compatible infusion solution. Dextrose 5% is recommended but sodium chloride 0.9% may also be used. <sup>(38)</sup> <sup>(115)</sup>

**Stability** — Salbutamol injection and infusion are clear, colorless, or pale straw-colored solutions. The intact containers should be stored below 30 °C and protected from light. <sup>(38)</sup> <sup>(115)</sup>

Salbutamol - AHFS 12:12.08.12

## Sargramostim (GM-CSF) - AHFS 20:16

**Products** — Sargramostim is available in single-dose vials labeled as 250 mcg. Reconstitute the vial with 1 mL of sterile water for injection or bacteriostatic water for injection containing benzyl alcohol 0.9% directed at the sides of the vial. Gently swirl to avoid foaming during dissolution, and do not shake. Each milliliter of the reconstituted solution contains sargramostim 250 mcg, mannitol 40 mg, sucrose 10 mg, and tromethamine 1.2 mg. <sup>(1-4/08)</sup> (4) The contents of vials reconstituted with different diluents should not be mixed. <sup>(1-4/08)</sup>

Sargramostim is also available as a preserved liquid formulation in 1-mL vials containing in each milliliter sargramostim 500 mcg along with mannitol 40 mg, sucrose 10 mg, tromethamine 1.2 mg, and benzyl alcohol 1.1% as an antimicrobial preservative. <sup>(1-4/08)</sup> (4)

**Specific Activity** — The specific activity is approximately  $5.6 \times 10^6$  units per milligram. <sup>(1-4/08)</sup>

**pH** — From 7.1 to 7.7. <sup>(1-4/08)</sup> (17)

**Trade Name(s)** — Leukine

**Administration** — Sargramostim may be administered by subcutaneous injection undiluted or by intravenous infusion usually over two to four hours after dilution in sodium chloride 0.9%. <sup>(1-4/08)</sup> (4) Intravenous infusion also has been performed. <sup>(4)</sup> For infusion concentrations below 10 mcg/mL, albumin human at a final concentration of 0.1% should be added to the intravenous solution prior to the addition of sargramostim to prevent adsorption. <sup>(1-4/08)</sup> (4)

The preparations containing benzyl alcohol (Leukine liquid, and lyophilized Leukine reconstituted with bacteriostatic water for injection containing benzyl alcohol) should not be used in neonates. <sup>(1-4/08)</sup>

**Stability** — Intact vials, reconstituted solutions, and sargramostim diluted in sodium chloride 0.9% should be stored under refrigeration. Solutions should be protected from freezing and not shaken. The liquid formulation is a clear, colorless solution. The white lyophilized powder forms a clear, colorless solution on reconstitution. The manufacturer recommends administration within six hours following reconstitution with sterile water for injection and/or dilution in an infusion solution and discarding any unused solution. When reconstituted with bacteriostatic water for injection preserved with benzyl alcohol 0.9%, the manufacturer states that the solution may be stored for up to 20 days under refrigeration. <sup>(1-4/08)</sup>

Other information indicates that sargramostim reconstituted with sterile water for injection or bacteriostatic water for injection is stable for 30 days at 25 °C or under refrigeration. <sup>(226)</sup>

**Syringes** — Sargramostim 250 mcg and 500 mcg reconstituted with 1 mL of bacteriostatic water for injection with benzyl alcohol 0.9% and repackaged in 1-mL tuberculin syringes (Becton Dickinson) is stated to be stable for 14 days when stored under refrigeration. <sup>(226)</sup>

**Sorption** — Sargramostim will adsorb to containers and tubing if the concentration is below 10 mcg/mL. Albumin human 0.1% should be added to the intravenous solution to prevent this. <sup>(1-4/08)</sup>

**Filtration** — Sargramostim should not be infused through an inline filter because of possible absorption. <sup>(1-4/08)</sup> (4)

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>e</sup>Tested with 0.1% albumin human added.

<sup>f</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>g</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>h</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration tazobactam sodium,

<sup>i</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

## Scopolamine Butylbromide - AHFS 12:08.08

**Products** — Scopolamine butylbromide 20 mg/mL with sodium chloride in water for injection is available in 1-mL ampuls.<sup>(115)</sup>

**Trade Name(s)** — Buscopan, Scoburen

**Administration** — Scopolamine butylbromide is administered by intramuscular or subcutaneous injection or slowly intravenously. Dextrose 5% and sodium chloride 0.9% are recommended for dilution if needed.<sup>(115)</sup>

**Stability** — Scopolamine butylbromide injection is a clear, colorless or nearly colorless solution. Intact containers should be stored below 30 °C and protected from light.<sup>(115)</sup>

### Compatibility Information

#### Additive Compatibility

##### Scopolamine butylbromide

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Floxacillin sodium	BE	20 g	BI	2 g	W	Physically compatible for 24 hr at 15 and 30 °C. Precipitate forms in 48 hr at 30 °C. No change in 48 hr at 15 °C	1479	C
Furosemide	HO	1 g	BI	2 g	W	Physically compatible for 72 hr at 15 and 30 °C	1479	C
Oxycodone HCl	NAP	1 g	BI	1 g	NS, W	Visually compatible. Under 4% concentration change in 24 hr at 25 °C	2600	C
Tramadol HCl	AND	11.18 g	BI	1.68 g	NS <sup>a</sup>	Visually compatible for 7 days at 25 °C protected from light	2701	C
Tramadol HCl	AND	5 g	BI	5 g	NS <sup>a</sup>	Visually compatible for 7 days at 25 °C protected from light	2701	C

<sup>a</sup>Tested in elastomeric pump reservoirs (Baxter).

#### Drugs in Syringe Compatibility

##### Scopolamine butylbromide

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Diamorphine HCl	EV	50 and 150 mg/1 mL	BI	20 mg/1 mL	Physically compatible with no scopolamine loss and 4% diamorphine loss in 7 days at room temperature	1455	C
Haloperidol lactate		0.3125 mg/mL	BI	2.5, 5, 10 mg/mL	Physically compatible. Less than 10% loss of both drugs in 15 days at 4 and 25 °C	2521	C
Haloperidol lactate		0.625 mg/mL	BI	2.5, 5, 10 mg/mL	Physically compatible. Less than 10% loss of both drugs in 7 days at 4 and 25 °C. Over 10% loss of scopolamine in 15 days at both temperatures	2521	C

Haloperidol lactate	1.25 mg/mL	BI	2.5, 5, 10 mg/mL	Physically incompatible. Haloperidol precipitates in 15 days at 25 °C and 7 days at 4 °C	<a href="#">2521</a> I
Oxycodone HCl	NAP 200 mg/20 mL	BI	60 mg/3 mL	Visually compatible. Under 4% concentration change in 24 hr at 25 °C	<a href="#">2600</a> C
Tramadol HCl	GRU 8.33, 16.67, 33.33 mg/mL <sup>a</sup>	BI	3.33, 4.99, 6.67 mg/mL <sup>a</sup>	Physically compatible with no loss of tramadol HCl and about 5 to 6% loss of scopolamine butylbromide in 15 days at 4 and 25 °C protected from light	<a href="#">2632</a> C

<sup>a</sup>Diluted with sodium chloride 0.9%.

## Scopolamine Hydrobromide (HYOSCINE HYDROBROMIDE) - AHFS 12:08.08

**Products** — Scopolamine hydrobromide is available in 1-mL multiple-dose vials containing 0.4- and 1-mg/mL concentrations. Also present in the products are methylparaben 0.18% and propylparaben 0.02%. Hydrobromic acid may have been used to adjust the pH. [\(1-6/06\)](#) [\(4\)](#)

*pH* — From 3.5 to 6.5. [\(1-6/06\)](#) [\(4\)](#)

*Osmolality* — The osmolality of scopolamine hydrobromide 0.5 mg/mL was determined to be 303 mOsm/kg. [\(1233\)](#)

**Administration** — Scopolamine hydrobromide may be administered subcutaneously, intramuscularly, or intravenously by direct intravenous injection after dilution with sterile water for injection. [\(1-6/06\)](#) [\(4\)](#)

**Stability** — The product should be stored at controlled room temperature and protected from light. [\(1-6/06\)](#) Scopolamine hydrobromide is stated to be incompatible with alkalis. [\(4\)](#) Scopolamine hydrobromide decomposition is primarily due to hydrolysis below pH 3 and to both hydrolysis and inversion about the chiral carbon above pH 3. The minimum rate of decomposition occurs at pH 3.5. [\(1072\)](#)

    Scopolamine Hydrobromide (HYOSCINE HYDROBROMIDE) - AHFS  
    12:08.08

## Sodium Acetate - AHFS 40:08

**Products** — Sodium acetate is available as a 16.4% solution in 20-, 50-, 100-, and 250-mL vials. Each milliliter of solution contains 2 mEq of sodium acetate in water for injection. Sodium acetate is also available as a 32.8% solution in 50- and 100-mL vials. Each milliliter of solution contains 4 mEq of sodium acetate in water for injection. The pH may have been adjusted with acetic acid. <sup>(1-9/06)</sup>

*pH* — From 6 to 7. <sup>(1-9/06)</sup> (17)

*Osmolarity* — Sodium acetate injection is very hypertonic and must be diluted for use. The 2-mEq/mL concentration has a calculated osmolarity of 4 mOsm/mL, and the 4-mEq/mL concentration has a calculated osmolarity of 8 mOsm/mL. <sup>(1-9/06)</sup>

**Administration** — Sodium acetate is administered by slow intravenous infusion after addition to a larger volume of fluid. It must not be given undiluted. <sup>(1-9/06)</sup>

**Stability** — The product should be stored at controlled room temperature and protected from freezing and excessive heat. Discarding the vials four hours after initial entry has been recommended. <sup>(1-9/06)</sup>

Sodium Acetate - AHFS 40:08

## Sodium Bicarbonate - AHFS 40:08

**Products** — Sodium bicarbonate injections are available from various manufacturers in vials, ampuls, bottles, and disposable syringes as aqueous solutions in concentrations ranging from 4.2% to 8.4%.<sup>(1-3/06)</sup> <sup>(4)</sup>

Concentration	Bicarbonate (and Sodium) Concentration	Total Container Content	Osmolarity
8.4%	1 mEq/mL	10 mEq/10 mL 50 mEq/50 mL	2000 mOsm/L
7.5%	0.892 mEq/mL	44.6 mEq/50 mL	1790 mOsm/L
5.0%	0.595 mEq/mL	297.5 mEq/500 mL	1200 mOsm/L
4.2%	0.5 mEq/mL	5 mEq/10 mL	1000 mOsm/L

Sodium bicarbonate 4 and 4.2% neutralizing additive solutions are available in 5-mL vials. Each milliliter of solution provides 0.48 or 0.5 mEq of bicarbonate and sodium, respectively.<sup>(1-3/06)</sup> <sup>(4)</sup> The sodium bicarbonate-neutralizing additive solutions are used to raise the pH of acidic solutions.

*Equivalency* — Each 84 mg of sodium bicarbonate provides 1 mEq of sodium and bicarbonate ions. Each gram of sodium bicarbonate provides about 12 mEq of sodium and bicarbonate ions.<sup>(4)</sup>

*pH* — From 7 to 8.5.<sup>(17)</sup>

**Administration** — Sodium bicarbonate is administered intravenously, either undiluted or diluted in other fluids. It may also be given subcutaneously if diluted to isotonicity (1.5%).<sup>(4)</sup>

**Stability** — Sodium bicarbonate injection should be stored at controlled room temperature and protected from freezing and excessive temperatures of 40 °C or above. Do not use a solution that is unclear or that contains a precipitate.<sup>(4)</sup>

Sodium bicarbonate injection under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38 °C over four weeks. Analysis found no loss of the drug under these conditions.<sup>(2562)</sup>

Combining sodium bicarbonate with acids in aqueous solutions results in the liberation of carbon dioxide gas. The bubbles can be evolved in sufficient quantity to cause effervescence.<sup>(4)</sup>

The stability of sodium bicarbonate 7.5% in polypropylene syringes is inversely related to the storage temperature.<sup>(136)</sup> Estimates of room temperature stability range from one week<sup>(137)</sup> to one month.<sup>(136)</sup> Refrigeration may increase the stability to 60<sup>(137)</sup> to 90 days.<sup>(136)</sup> Stability may also be increased by refrigerating the sodium bicarbonate injection and the syringes before preparation, rinsing the syringes twice with refrigerated sterile water for injection, minimizing the contact of the solution with the air by expelling the air from the syringes, and taping the plunger in place to minimize its movement from escaping carbon dioxide.<sup>(137)</sup>

*pH Effects* — Drugs such as sodium bicarbonate that may raise the pH of an admixture above 6 may cause significant decomposition of alkali-labile drugs.<sup>(59)</sup> <sup>(77)</sup> <sup>(79)</sup>

The change in pH that occurs when 5 mL of Neut is added to a liter of 10 common infusion solutions was reported:

Solution	Initial pH	pH after Neut	pH Increase
----------	------------	------------------	----------------

	<b>Added</b>		
Dextrose 5% in Electrolyte #48	5.0	6.1	1.1
Dextrose 5% in Electrolyte #75	4.7	5.5	0.8

loss in 24 hr

Dobutamine HCl	LI	1 g	IX	500 mEq	D5W, NS	White precipitate in 6 hr at 21 °C	<a href="#">812</a>	I
Dopamine HCl	AS	800 mg	MG	5%		Color change 5 min after mixing	<a href="#">79</a>	I
Epinephrine HCl		4 mg	AB	2.4 mEq <sup>a</sup>	D5W	Epinephrine inactivated	<a href="#">772</a>	I
Epinephrine HCl		4 mg		5%		Epinephrine rapidly decomposes. 58% loss immediately after mixing	<a href="#">48</a>	I
Ertapenem sodium	ME	10 and 20 g	AB	5%		Visually compatible. 11% loss in 3 hr at 25 °C. 16 to 19% loss in 1 day at 4 °C	<a href="#">2487</a>	I
Erythromycin lactobionate	AB	1 g	AB	3.75 g		Physically compatible. Erythromycin stable for 24 hr at 25 °C	<a href="#">20</a>	C
Erythromycin lactobionate	AB	1 g	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Esmolol HCl	ACC	10 g	MG <sup>c</sup>	5%		Visually compatible. 5 and 8% esmolol losses in 7 days at 4 and 27 °C, respectively	<a href="#">1831</a>	C
Fat emulsion, intravenous	VT	10%	BR	7.5 g		Physically compatible for 48 hr at 4 °C and room temperature	<a href="#">32</a>	C
Fat emulsion, intravenous	VT	10%		3.4 g		Lipid coalescence in 24 hr at 8 and 25 °C	<a href="#">825</a>	I
Furosemide	HO	1 g	IMS	8.4%		Physically compatible for 72 hr at 15 and 30 °C	<a href="#">1479</a>	C
Heparin sodium	AB	20,000 units	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Hyaluronidase	WY	150 units	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Imipenem-cilastatin sodium	MSD	2.5 g	AB	5%		43% imipenem loss in 3 hr at 25 °C and 52% in 24 hr at 4 °C	<a href="#">1141</a>	I

Imipenem-cilastatin sodium	MSD	5 g	AB	5%		45% imipenem loss in 3 hr at 25 °C and 50% in 24 hr at 4 °C	<a href="#">1141</a>	I
Isoproterenol HCl	WI	5 mg		5%		Isoproterenol decomposition	<a href="#">48</a>	I
Isoproterenol HCl	BN	1 mg	AB	2.4 mEq <sup>a</sup>	D5W	Isoproterenol decomposition	<a href="#">772</a>	I
Labetalol HCl	SC	1.25, 2.5, 3.75 g	TR	5%		White precipitate forms within 6 hr after mixing at 4 and 25 °C	<a href="#">757</a>	I
Levofloxacin	OMJ	0.5 g	BA	5% <sup>b</sup>		Physically compatible. No loss in 3 days at 25 °C, 14 days at 5 °C, in dark	<a href="#">1986</a>	C
Levofloxacin	OMJ	0.5 g	BA	5% <sup>b</sup>		Precipitate forms within 13 weeks at -20 °C	<a href="#">1986</a>	I
Levofloxacin	OMJ	5 g	BA	5% <sup>b</sup>		Physically compatible. No loss in 3 days at 25 °C, 14 days at 5 °C, 26 weeks at -20 °C, in dark	<a href="#">1986</a>	C
Lidocaine HCl	AST	2 g	AB	40 mEq		Physically compatible	<a href="#">24</a>	C
Lidocaine HCl		1 g	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Magnesium sulfate	LI	16 mEq	AB	80 mEq	D5W	Physically incompatible	<a href="#">15</a>	I
Magnesium sulfate	HOS	1.5 and 15 mEq	BA	50 mEq	<sup>h</sup>	Physically compatible. No loss of ions for 48 hr at 23 °C	<a href="#">2814</a>	C
Mannitol	AMR	25 g	AB	44.6 mEq	D5LR, D5(1/4)S, D5(1/2)S, D5S, D5W, D10W, NS, (1/2)S <sup>d</sup>	Visually compatible for 24 hr at 24 °C	<a href="#">1853</a> <a href="#">1973</a>	C
Meperidine HCl	WI	100 mg	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Meropenem	ZEN	1 g	BA	5%		10% meropenem loss in 4 hr at 24 °C and 18 hr at 4 °C	<a href="#">2089</a>	I <sup>g</sup>
Meropenem	ZEN	20 g	BA	5%		9 to 10% meropenem loss in 3 hr at 24 °C and 18 hr at 4 °C	<a href="#">2089</a>	I <sup>g</sup>

Methotrexate sodium		2 g		50 mEq		No photodegradation products in 12 hr in room light	<a href="#">433</a>	C
Methotrexate sodium	LE	750 mg		50 mEq	D5W	6% methotrexate loss in 1 week at 5 °C in dark. At 23 °C in light, 6% loss in 72 hr and 15% in 1 week	<a href="#">465</a>	C
Methyldopate HCl	MSD	1 g		50 mEq	D, D-S, S	Physically compatible	<a href="#">23</a>	C
Methyldopate HCl	MSD	1 g	AB	5%		Stable for 24 hr	<a href="#">23</a>	C
Midazolam HCl	RC	100 mg	<a href="#">c</a>	5%		Transient precipitation upon mixing	<a href="#">355</a>	?
Midazolam HCl	RC	500 mg	<a href="#">c</a>	5%		Precipitation upon mixing	<a href="#">355</a>	I
Multivitamins	USV	10 mL	AB	4.8 mEq <sup>e</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Nafcillin sodium	WY	500 mg	AB	40 mEq		Physically compatible	<a href="#">27</a>	C
Nicardipine HCl	DME	50 and 500 mg	TR <sup>c</sup>	5%		Precipitate forms immediately	<a href="#">1380</a>	I
Norepinephrine bitartrate	WI	2 mg	AB	80 mEq	D5W	Physically incompatible	<a href="#">15</a>	I
Norepinephrine bitartrate	BN	8 mg	AB	2.4 mEq <sup>a</sup>	D5W	Norepinephrine decomposition	<a href="#">772</a>	I
Oxytocin	PD	5 units	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Penicillin G potassium		100 million units	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Penicillin G potassium	SQ	1 million units	AB	3.75 g	D5W	26% penicillin loss in 24 hr at 25 °C	<a href="#">47</a>	I
Penicillin G potassium	SQ	1 million units		0.5 and 0.75 g	D5W	Penicillin loss at 20 °C due to pH	<a href="#">135</a>	I
Penicillin G potassium	<a href="#">f</a>	900,000 units		3.75 g	D5W	26% penicillin loss in 24 hr at 25 °C	<a href="#">48</a>	I
Pentazocine lactate	WI	300 mg	AB	80 mEq	D5W	Physically incompatible	<a href="#">15</a>	I
Pentobarbital sodium	AB	1 g	AB	80 mEq	D5W	Physically incompatible	<a href="#">15</a>	I
Phenylephrine HCl	WI	10 mg	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Phenylephrine HCl	WI	20 mg		5%		Stable for 24 hr at 25 °C	<a href="#">48</a>	C

Phytonadione	MSD	10 mg	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Potassium chloride		120 mEq	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Prochlorperazine edisylate	SKF	10 mg	AB	2.4 mEq <sup>a</sup>	D5W	Physically compatible for 24 hr	<a href="#">772</a>	C
Succinylcholine chloride	AB	1 g	AB	2.4 mEq <sup>a</sup>	D5W	Succinylcholine decomposition	<a href="#">772</a>	I
Verapamil HCl	KN	80 mg	BR	89.2 mEq	D5W, NS	Physically compatible for 24 hr	<a href="#">764</a>	C
Voriconazole	PF			4.2%		Voriconazole slightly decomposes at room temperature	<a href="#">1(3/06)</a>	I

<sup>a</sup>One vial of Neut added to a liter of admixture.

<sup>b</sup>Tested in PVC containers.

<sup>c</sup>Tested in glass containers.

<sup>d</sup>Tested in polyolefin containers.

<sup>e</sup>Two vials of Neut added to a liter of admixture.

<sup>f</sup>A buffered preparation was specified.

<sup>g</sup>Incompatible by conventional standards but may be used in shorter periods of time.

<sup>h</sup>Tested in an extemporaneously-compounded hemofiltration solution.

<sup>i</sup>Final sodium bicarbonate concentration not specified.

### Drugs in Syringe Compatibility

#### Sodium bicarbonate

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Bupivacaine HCl	AST, WI	0.25, 0.5 <sup>a</sup> , 0.75% <sup>a</sup> , 20 mL	AB	4%, 0.05 to 0.6 mL	Precipitate forms in 1 to 2 min up to 2 hr at lowest amount of bicarbonate	<a href="#">1724</a>	I
Bupivacaine HCl	BEL	0.5% <sup>b</sup> , 20 mL		1.4%, 1.5 mL	No epinephrine loss in 7 days at room temperature. Bupivacaine not tested	<a href="#">1743</a>	C
Bupivacaine HCl	BEL	0.5% <sup>b</sup> , 20 mL		4.2 and 8.4%, 1.5 mL	5 to 7% epinephrine loss in 7 days at room temperature. Bupivacaine not tested	<a href="#">1743</a>	C
Caffeine citrate		20 mg/1 mL	AST	4.2%, 1 mL	Visually compatible for 4 hr at 25 °C	<a href="#">2440</a>	C

Dimenhydrinate		10 mg/1 mL		1 mEq/1 mL	Precipitates immediately	<a href="#">2569</a>	I
Glycopyrrolate	RB	0.2 mg/1 mL	AB	75 mg/1 mL	Gas evolves	<a href="#">331</a>	I
Glycopyrrolate	RB	0.2 mg/1 mL	AB	150 mg/2 mL	Gas evolves	<a href="#">331</a>	I
Glycopyrrolate	RB	0.4 mg/2 mL	AB	75 mg/1 mL	Gas evolves	<a href="#">331</a>	I
Lidocaine HCl	ES	2% <sup>c</sup> , 30 mL	AB	3 mEq/3 mL	11% lidocaine and 28% epinephrine loss in 1 week at 25 °C	<a href="#">1712</a>	I
Lidocaine HCl	ES	2% <sup>c</sup> , 30 mL	AB	3 mEq/3 mL	6% lidocaine loss in 4 weeks at 4 °C. 12% epinephrine loss in 3 weeks at 4 °C	<a href="#">1712</a>	C
Lidocaine HCl	AST	1% <sup>c</sup>	LY	0.1 mEq/mL	25% epinephrine loss in 1 week at room temperature. Lidocaine not tested	<a href="#">1713</a>	I
Lidocaine HCl		0.9%		0.088 mEq/mL	11% lidocaine loss in 7 days at room temperature	<a href="#">1723</a>	C
Lidocaine HCl	AST	1 and 1.5% <sup>a</sup> , 20 mL	AST	8.4%/2 mL	Visually compatible for up to 5 hr at room temperature	<a href="#">1724</a>	C
Lidocaine HCl	AST	2% <sup>a</sup> , 20 mL	AST	8.4%/2 mL	Haze forms but dissipates with gentle agitation	<a href="#">1724</a>	?
Lidocaine HCl	AST	1 and 1.5% <sup>a</sup> , 20 mL	AB	4%/4 mL	Visually compatible for up to 5 hr at room temperature	<a href="#">1724</a>	C
Lidocaine HCl	AST	2% <sup>a</sup> , 20 mL	AB	4%/4 mL	Haze forms but dissipates with gentle agitation	<a href="#">1724</a>	?
Lidocaine HCl	BEL	2% <sup>d</sup> , 20 mL		1.4 and 8.4%/1.5 mL	8% epinephrine loss in 7 days at room temperature. Lidocaine not tested	<a href="#">1743</a>	C
Lidocaine HCl		2%/10 mL		8.4%/1 mL	Physically compatible. No loss of lidocaine in 6 hr	<a href="#">1401</a>	C
Lidocaine HCl		2% <sup>c</sup> , 10 mL		8.4%/1.5 mL	Physically compatible. No loss of lidocaine or epinephrine in 6 hr	<a href="#">1401</a>	C
Lidocaine HCl		2% <sup>c</sup> , 10 mL		1.4%/1.5 mL	Physically compatible. No loss of lidocaine or epinephrine in 6 hr	<a href="#">1401</a>	C
Lidocaine HCl		1% <sup>c</sup> , 10 mL		8.4%/1 mL	Cloudiness in some samples with no epinephrine loss for 72 hr in the dark. Exposed to light and air, precipitation and 20% epinephrine loss in 24 hr. Lidocaine not tested	<a href="#">2408</a>	?
Lidocaine HCl	ASZ	1 and 2% <sup>c</sup> , 2.7 mL	HOS	8.4%/0.3 mL	Physically compatible. 10% epinephrine loss in 7 days and 5% lidocaine loss in 28 days at 5 °C in dark	<a href="#">2815</a>	C
Mepivacaine HCl	AST, WI	1 and 1.5%/20 mL	AST	8.4%; 0.5, 1, 2 mL	Precipitate forms within approximately 1 hr	<a href="#">1724</a>	I
Mepivacaine HCl	AST, WI	1 and 1.5%/20 mL	AB	4%; 1, 2, 4 mL	Precipitate forms within approximately 1 hr	<a href="#">1724</a>	I
Metoclopramide HCl	RB	10 mg/2 mL	AB	100 mEq/100 mL	Gas evolves	<a href="#">1167</a>	I

Metoclopramide HCl	RB	160 mg/32 mL	AB	100 mEq/100 mL	Gas evolves	<a href="#">1167</a>	I
Milrinone lactate	STR	5.25 mg/5.25 mL	AB	3.75 g/50 mL	Physically compatible. No milrinone loss in 20 min at 23 °C	<a href="#">1410</a>	C
Pantoprazole sodium	<sup>e</sup>	4 mg/1 mL		1 mEq/1 mL	Precipitates after 1 hr	<a href="#">2574</a>	I
Pentobarbital sodium	AB	500 mg/10 mL		3.75 g/50 mL	Physically compatible	<a href="#">55</a>	C

<sup>a</sup>Tested with and without epinephrine hydrochloride 1:200,000 added.

<sup>b</sup>Tested with epinephrine hydrochloride 1:200,000 added.

<sup>c</sup>Tested with epinephrine hydrochloride 1:100,000 added.

<sup>d</sup>Tested with epinephrine hydrochloride 1:80,000 added.

<sup>e</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in sodium chloride 0.45%.

<sup>d</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>e</sup>Tested in combination with heparin sodium (Riker) 1000 units/L.

<sup>f</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>g</sup>Tested in combination with hydrocortisone sodium succinate (Upjohn) 100 mg/L.

<sup>h</sup>Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>i</sup>Tested in dextrose 5% with potassium chloride 0.02 mM/mL.

<sup>j</sup>Lyophilized formulation tested.

<sup>k</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>l</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>m</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

### **Additional Compatibility Information**

*Methylprednisolone* — The compatibility of methylprednisolone sodium succinate (Upjohn) with sodium bicarbonate added to an auxiliary medication infusion unit has been studied. Primary admixtures were prepared by adding sodium bicarbonate 44.6 mEq/L to dextrose 5%, dextrose 5% in sodium chloride 0.9%, and Ringer's injection, lactated. Up to 100 mL of the primary admixture was added along with methylprednisolone sodium succinate (Upjohn) to the auxiliary medication infusion unit with the following results<sup>(329)</sup> :

<b>Methylprednisolone Sodium Succinate</b>	<b>Sodium Bicarbonate 44.6 mEq/L Primary Solution</b>	<b>Results</b>
500 mg	D5S, D5W qs 100 mL	Clear solution for 24 hr
500 mg	LR qs 100 mL or added to 100 mL LR	Clear solution for 1 hr
1000 mg	D5W qs 100 mL	Clear solution for 24 hr
1000 mg	D5S qs 100 mL or added to 100 mL D5S	Clear solution for 24 hr
1000 mg	LR qs 100 mL	Clear solution for 1 hr
1000 mg	Added to 100 mL LR	Clear solution for 4 hr
2000 mg	D5S, D5W qs 100 mL	Clear solution for 24 hr
2000 mg	LR qs 100 mL	Clear solution for 30 min
2000 mg	Added to 100 mL LR	Clear solution for 4 hr

Sodium Bicarbonate - AHFS 40:08

## Sodium Chloride - AHFS 40:12

**Products** — Sodium chloride additive solution is available in various size containers in concentrations of 14.6 and 23.4%. The 14.6% concentration contains sodium chloride 146 mg/mL and provides 2.5 mEq/mL of sodium and chloride ions. The 23.4% concentration contains sodium chloride 234 mg/mL and provides 4 mEq/mL of sodium and chloride ions.<sup>(1-2/06)</sup>

NOTE: Do not confuse these high concentration additive solutions with other sodium chloride products with lower concentrations.

Sodium chloride 0.45 and 0.9% infusion solutions are available in a variety of sizes from 25 to 1000 mL. The 0.45 and 0.9% concentrations provide 77 and 154 mEq of sodium and chloride per liter, respectively.<sup>(1-2/06)</sup> (4)

*pH* — From 4.5 to 7.<sup>(17)</sup>

*Osmolarity* — Sodium chloride additive solutions are very hypertonic and must be diluted for use. The osmolarities of the 14.6 and 23.4% concentrations have been calculated to be about 5000 and 8000 mOsm/L, respectively.<sup>(4)</sup> The osmolality of the 14.6% concentration was determined to be 5370 mOsm/kg by freezing-point depression and 4783 mOsm/kg by vapor pressure.<sup>(1071)</sup> A 0.9% sodium chloride solution is isotonic, having an osmolarity of 308 mOsm/L. A 0.45% sodium chloride solution is hypotonic, having a calculated osmolarity of 154 mOsm/L.<sup>(4)</sup>

**Administration** — Sodium chloride additive solutions of 14.6 and 23.4% are administered by intravenous infusion only after dilution in a larger volume of fluid.<sup>(4)</sup> Dextrose 5% has been recommended for this dilution.<sup>(1-2/06)</sup> When concentrations of 3 or 5% are indicated, these hypertonic solutions should be administered into a large vein, at a rate not exceeding 100 mL/hr. Infiltration should be avoided.<sup>(4)</sup>

**Stability** — Sodium chloride additive solution should be stored at controlled room temperature and protected from excessive heat and freezing.<sup>(1-2/06)</sup>

*Elastomeric Reservoir Pumps* — Sodium chloride 0.9% (Baxter) 250 mL was filled into Intermate LV 250 (Baxter) elastomeric infusion devices and stored at 5 and 23 °C for 90 days. The solution remained visually compatible with no change in pH and sodium or chloride concentration and less than 0.1% water loss.<sup>(1993)</sup>

Sodium Chloride - AHFS 40:12

## Sodium Lactate - AHFS 40:08

**Products** — Sodium lactate additive solution is available in 10-mL vials. Each milliliter of solution contains 5 mEq of sodium lactate. The 10-mL vial contains a total of 50 mEq each of Na<sup>+</sup> and lactate ion (5.6 g of sodium lactate). The pH is adjusted with hydrochloric acid, lactic acid, or sodium hydroxide if necessary. <sup>(1-10/06)</sup> <sup>(4)</sup>

Sodium lactate (1/6) M (1.9%) infusion solution is available in 500- and 1000-mL containers. It provides 167 mEq of sodium and lactate per liter. <sup>(4)</sup>

*pH* — From 6 to 7.3. <sup>(1-10/06)</sup> <sup>(17)</sup>

*Osmolality* — Sodium lactate additive solution is very hypertonic and must be diluted for use. The osmolarity was calculated to be about 10,000 mOsm/L. <sup>(1-10/06)</sup> The osmolality was determined to be 11,490 mOsm/kg by freezing-point depression and 10,665 mOsm/kg by vapor pressure. <sup>(1071)</sup>

Sodium lactate (1/6) M (1.9%) is approximately isotonic with a calculated osmolarity of 330 mOsm/L. <sup>(4)</sup>

**Administration** — Sodium lactate additive solution is administered by intravenous infusion only after dilution in a larger volume of fluid. A (1/6) M (1.9%) solution may be prepared by diluting 50 mEq of the additive solution to 300 mL with a nonelectrolyte solution or sterile water for injection. Sodium lactate (1/6) M infusion solution does not require dilution prior to use. The rate of infusion should not exceed 300 mL/hr in adults. <sup>(1-10/06)</sup> <sup>(4)</sup>

**Stability** — Sodium lactate additive solution should be stored at controlled room temperature and protected from freezing and excessive temperatures of 40 °C or more. <sup>(1-10/06)</sup> <sup>(4)</sup>

  - Sodium Lactate - AHFS 40:08

## Sodium Nitroprusside - AHFS 24:08.20

**Products** — Sodium nitroprusside (Nitropress) is available in vials containing 50 mg of sodium nitroprusside dihydrate. Reconstitute with 2 to 3 mL of dextrose 5% or sterile water for injection (without preservative). Bacteriostatic water for injection should not be used, because preservatives increase the rate of decomposition.<sup>(4) (457)</sup>

Sodium nitroprusside is also available in 2-mL vials as a 25-mg/mL solution of sodium nitroprusside dihydrate in water for injection.<sup>(1-10/07)</sup>

For administration, dilute the reconstituted solution or the liquid form in dextrose 5%. The infusion containers should be wrapped in aluminum foil or other opaque material for light protection. The manufacturer states that it is not necessary to cover the infusion drip chamber or tubing. However, AHFS recommends covering the tubing.<sup>(1-10/07) (4)</sup>

*pH* — The pH in dextrose 5% is 3.5 to 6.<sup>(4)</sup>

*Sodium Content* — Contains sodium 0.335 mEq/50 mg of drug.<sup>(846)</sup>

*Trade Name(s)* — Nitropress

**Administration** — Sodium nitroprusside is administered only as an intravenous infusion by freshly reconstituting the drug and diluting 50 mg in 250 to 1000 mL of dextrose 5%. An infusion pump, microdrip regulator, or similar device should be used to control the flow rate precisely. Extravasation should be avoided.<sup>(1-10/07) (4)</sup>

**Stability** — Sodium nitroprusside is a reddish-brown color. Sodium nitroprusside in intact containers should be stored at controlled room temperature and protected from light and heat and from freezing for the liquid product.<sup>(1-10/07) (4)</sup>

Sodium nitroprusside protected from light has been reported to be stable for 12 to 24 hours<sup>(93) (460) (1296) (1579)</sup>, to 48 hours<sup>(958)</sup>, to 13 days<sup>(95)</sup>, or even longer.<sup>(94) (458) (459) (732)</sup> It is recommended that reconstituted sodium nitroprusside solutions be used within 24 hours when stored adequately protected from light.<sup>(4)</sup>

Sodium nitroprusside reacts with even minute quantities of a wide variety of inorganic and organic substances, forming highly colored reaction products (usually blue, green, or dark red). Such solutions should not be used. It is, therefore, recommended that no drug or preservative be added to sodium nitroprusside solutions.<sup>(4)</sup>

Dextrose 5% is the recommended infusion solution for admixture<sup>(1-10/07) (4) (90) (91)</sup> although it turns blue more rapidly than the drug in saline solution.<sup>(732)</sup>

Sodium nitroprusside 1 mg/mL in six solutions in PVC bags was evaluated for production of cyanide, produced by sodium nitroprusside degradation from exposure to 300 foot-candles of light for 72 hours. The solutions tested included three nonelectrolyte solutions (dextrose 5%, dextrose 10%, distilled water) and three electrolyte solutions (sodium chloride 0.9%, Ringer's injection, lactated, Ringer's injection, lactated, with dextrose 5%). There was no difference in the amount of cyanide produced among the solutions throughout the first 24 hours. However, the electrolyte solutions exhibited statistically significant lower mean cyanide ion concentrations, about 2 to 5 ppm, than the nonelectrolyte solutions (about 7 to 9 ppm). These levels of cyanide are an order of magnitude greater than in light-protected solutions. It was concluded that electrolyte solutions may be preferable to dextrose 5% for sodium nitroprusside administration and that all doses should be prepared as fresh as possible and protected from light.<sup>(2023)</sup>

*Temperature Effects* — Sodium nitroprusside solutions are heat sensitive. Autoclaving a solution of 100 mg/250 mL in dextrose 5% at 115 °C for 30 minutes results in decomposition to a pale blue-green precipitate.<sup>(458)</sup> It has been stated that autoclaving is less deleterious than even moderate exposure to light.<sup>(94)</sup>

*Light Effects* — Solutions of sodium nitroprusside exhibit a color variously described as brownish<sup>(4)</sup>, brown<sup>(90)</sup>, brownish-pink<sup>(91)</sup>, light orange<sup>(95)</sup>, and straw.<sup>(92)</sup> These solutions are highly sensitive to light. Exposure to light causes decomposition, resulting in a highly colored solution of orange<sup>(92)</sup>, dark brown<sup>(91)</sup>, or blue.<sup>(4) (90) (91) (92)</sup> A blue color indicates almost complete degradation.<sup>(92)</sup>

The rate of decomposition of sodium nitroprusside when exposed to light is dependent on such factors as the wavelength and intensity of light, temperature, infusion fluid, pH, and container material. The amount of loss occurring in the administration tubing can be affected additionally by the nature and thickness of the tubing wall, duration of light exposure, volume of fluid, and flow rate.<sup>(1297)</sup>

In one study, sodium nitroprusside 0.01% in both water and dextrose 5% in glass bottles exhibited 9 to 10% decomposition in two hours and 18 to 20% decomposition in four hours on exposure to fluorescent light. No decomposition was detected in either solution in 24 hours when protected from light. In PVC bags, even greater decomposition occurred on exposure to light.<sup>(460)</sup>

In another study, 10-mg/mL aqueous solutions of sodium nitroprusside lost 3% in 24 hours on exposure to fluorescent light and 10% in 24 hours when exposed to both fluorescent light and indirect daylight. At a concentration of 200 mg/L in infusion solutions, exposure to bright daylight increased the loss to approximately 15 to 30% in five hours. The rate of breakdown was related to the amount of illumination. When the containers were protected from light by wrapping with foil, no decomposition was observed in infusion solutions for seven days at room temperature and for two years at 10 mg/mL in glass tubes at room temperature or 4 °C.<sup>(732)</sup>

The rate of decomposition of sodium nitroprusside (David Bull Laboratories) 1 mg/mL in dextrose 5% was studied when exposed to fluorescent light and natural daylight. The solutions were stored at 23 °C in the burette chambers of an amber light-protective set, a clear colorless set, and a clear set covered with a foil overwrap. With exposure to fluorescent light, losses in the clear burette chamber totaled 11% in 150 minutes and 100% in 24 hours. Both the amber and foil-wrapped clear sets sustained virtually no loss in four hours and about a 3 to 4% loss in 24 hours. Natural daylight caused a more rapid drug loss in the unprotected burette; essentially all drug was lost in 30 to 150 minutes, depending on the daylight intensity. The amber set slowed the degradation rate, but 32% was still lost in two hours with exposure to intense direct sunlight.<sup>(1296)</sup>

Solutions of sodium nitroprusside should be protected from light by wrapping the container with aluminum foil or some other opaque material.<sup>(4) (90) (91) (1297)</sup> The container should be wrapped as soon as practical without delaying therapy.<sup>(959)</sup> Amber plastic bags, which are often used for light protection, have been stated not to provide sufficient protection for sodium nitroprusside against photodegradation. Only opaque materials should be used.<sup>(733)</sup>

The effect of the light exposure that sodium nitroprusside infusions receive while flowing through a 3-m long PVC infusion set tubing was evaluated. Sodium nitroprusside infusions in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated, were studied for 24 and eight hours at flow rates of 10 and 50 mL/hr, respectively. The delivered amount of sodium nitroprusside was not reduced.<sup>(958)</sup>

The stability of sodium nitroprusside (Roche) 100 mcg/mL in dextrose 5% was studied when delivered through tubing exposed to normal room light. No degradation occurred in the infusion container wrapped in foil, but concentration differences in the delivered solution of about 2% were noted at each time point sampled over the five-hour study. When the effects of different light sources on a 50-mcg/mL solution in dextrose 5% were compared, about a 7% loss occurred on

exposure to fluorescent light for six hours but a 32% loss occurred in one hour on exposure to direct sunlight. <sup>(1131)</sup>

The stability of sodium nitroprusside (Roche) 0.5 and 1.67 mg/mL in dextrose 5% administered by a syringe pump system was evaluated. In polypropylene syringes (Sherwood Medical) exposed to both artificial light and daylight, sodium nitroprusside losses after 24 hours were 26.0 and 18.7% at 0.5 and 1.67 mg/mL, respectively. The level of free cyanide exceeded 2 mcg/mL. The time to 10% decomposition was about four hours. Syringes wrapped in foil exhibited less than a 5% loss in 24 hours. A comparison of the decomposition occurring in the delivery tubing showed that about 10.3 and 3.7% were lost from the 0.5- and 1.67-mg/mL concentrations, respectively, when delivered by pumps at 3 mL/hr through tubing exposed to the light. Wrapping the line with foil prevented any decomposition over the 24-hour study. <sup>(1130)</sup>

Sodium nitroprusside (Roche) 50 mg/50 mL in dextrose 5% exhibited no change in appearance and no loss when stored for 24 hours at 25 °C in 60-mL plastic syringes (Becton Dickinson) wrapped in foil. However, if the syringes were not wrapped in foil for light protection, the solution turned yellow in 12 hours and had 11 and 17% losses in six and 12 hours, respectively. <sup>(1579)</sup>

*Sorption* — Sodium nitroprusside was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes. <sup>(536) (606) (1131)</sup>

### Compatibility Information

Sodium Nitroprusside - AHFS 24:08.20

## Sodium Phosphates - AHFS 40:12

**Products** — Sodium phosphates additive solution is available in 5-, 15-, and 50-mL vials. Each milliliter contains monobasic sodium phosphate monohydrate 276 mg and dibasic sodium phosphate anhydrous 142 mg. The phosphorus concentration is 3 mmol/mL (93 mg/mL), and the sodium content is 4 mEq/mL (92 mg/mL). The additive solution is a concentrate and must be diluted for use. <sup>(1-6/06)</sup>

*pH* — From 5.0 to 6.0. <sup>(1-6/06)</sup>

*Osmolarity* — Sodium phosphates additive solution is very hypertonic. The osmolarity of sodium phosphates additive solution is calculated to be 12 mOsm/mL. <sup>(1-6/06)</sup>

**Administration** — Sodium phosphates additive solution must be diluted and thoroughly mixed in a larger volume of fluid before use. <sup>(1-6/06)</sup>

**Stability** — Sodium phosphates additive solution should be stored at room temperature. The solution should be inspected for discoloration or particulate matter prior to use and should be used only if it is clear. The injection contains no antibacterial preservative. After the vials have been entered, discard any unused portions. <sup>(1-6/06)</sup>

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both sodium chloride 0.9% and 0.45%.

<sup>d</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>e</sup>Tested in Ringer's injection, lactated.

---

### **Additional Compatibility Information**

*Calcium and Phosphate* — Phosphates may be incompatible with metal ions such as magnesium and calcium. A number of studies using potassium phosphate have been performed. For additional information, refer to the potassium phosphate monograph.

### **UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.**

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented<sup>(1771) (1777)</sup>, but the information is complex and difficult to apply to the clinical situation.<sup>(1770) (1772) (1777)</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that is present, which has led to substantial debate on the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>(1770) (1771) (1772) (2031) (2032) (2033) (2034) (2035) (2036)</sup> Because such precipitation may be life-threatening to patients<sup>(2037) (2291)</sup>, the Food and Drug Administration issued a Safety Alert containing the following recommendations<sup>(1769)</sup> :

"1. The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a three-in-one admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a two-in-one admixture with the lipid infused separately, or (2) if a three-in-one admixture is medically necessary, then add the calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

4. During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.

5. A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu\text{m}$  air-eliminating filter for lipid-containing admixtures and a 0.22- $\mu\text{m}$  air-eliminating filter for non-lipid-containing admixtures.

6. Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

7. If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance."

*Calcium Phosphate Precipitation Fatalities* — Fatal cases of paroxysmal respiratory failure in two previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures.<sup>(2037)</sup>

In a follow-up retrospective review, five patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these five patients died, although the cause of death could be definitively determined for only two.<sup>(2291)</sup>

*Calcium and Phosphate Conditional Compatibility* — Calcium salts are conditionally compatible with phosphates in parenteral nutrition solutions. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acid solutions inherently contain calcium and phosphate, which must be considered in any projection of compatibility.

A study determined the maximum concentrations of calcium (as chloride and gluconate) and phosphate that can be maintained without precipitation in a parenteral nutrition solution consisting of FreAmine II 4.25% and dextrose 25% for 24 hours at 30 °C. It was noted that the amino acids in parenteral nutrition solutions form soluble complexes with calcium and phosphate, reducing the available free calcium and phosphate that can form insoluble precipitates. The concentration of calcium available for precipitation is greater with the chloride salt compared to the gluconate salt, at least in part because of differences in dissociation characteristics. Consequently, a greater concentration of calcium gluconate than calcium chloride can be mixed with sodium phosphate.<sup>(608)</sup>

In addition to the concentrations of phosphate and calcium and the salt form of the calcium, the concentration of amino acids and the time and temperature of storage altered the formation of calcium phosphate in parenteral nutrition solutions. As the temperature was increased, the incidence of precipitate formation also increased. This finding was attributed, at least in part, to a greater degree of dissociation of the calcium and phosphate complexes and the decreased solubility of calcium phosphate. Therefore, a solution possibly may be stored at 4 °C with no precipitation, but on warming to room temperature a precipitate will form over time.<sup>(608)</sup>

The solubility characteristics of calcium and phosphate in pediatric parenteral nutrition solutions

composed of Aminosyn 0.5, 2, and 4% with dextrose 10 to 25% were reported. Also present were electrolytes and vitamins. Sodium phosphate was added sequentially in phosphorus concentrations from 10 to 30 mmol/L. Calcium gluconate was added last in amounts ranging from 1 to 10 g/L. The solutions were stored at 25 °C for 30 hours and examined visually and microscopically for precipitation. The authors found that higher concentrations of Aminosyn increased the solubility of calcium and phosphate. Precipitation occurred at lower calcium and phosphate concentrations in the 0.5% solution compared to the 2 and 4% solutions. For example, at a phosphorus concentration of 30 mmol/L, precipitation occurred at calcium gluconate concentrations of about 1, 2, and 4 g/L in the 0.5, 2, and 4% Aminosyn mixtures, respectively. Similarly, at a calcium gluconate concentration of 8 g/L and above, precipitation occurred at phosphorus concentrations of about 13, 17, and 22 mmol/L in the 0.5, 2, and 4% solutions, respectively. The dextrose concentration did not appear to affect the calcium and phosphate solubility significantly.<sup>(1042)</sup>

The maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix I) were reported. Added calcium was varied from 1.5 to 150 mmol/L, and added phosphate was varied from 21 to 300 mmol/L. These mixtures were stable for 48 hours at 22 and 37 °C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mmol/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup>.<sup>(1773)</sup>

Additional calcium and phosphate solubility curves were reported for specialty parenteral nutrition solutions based on NephroAmine and also HepatoAmine at concentrations of 0.8, 1.5, and 2% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment to simulate addition of fat emulsion used in some admixtures. Calcium and phosphate solubility followed the hyperbolic patterns previously reported.<sup>(609)</sup> Temperature, time, and pH affected calcium and phosphate solubility, with pH having the greatest effect.<sup>(2038)</sup>

The maximum sodium phosphate concentrations were reported for given amounts of calcium gluconate that could be admixed in parenteral nutrition solutions containing TrophAmine in varying quantities (with cysteine hydrochloride 40 mg/g of amino acid) and dextrose 10%. The solutions also contained magnesium sulfate 4 mEq/L, potassium acetate 24 mEq/L, sodium chloride 32 mEq/L, pediatric multivitamins, and trace elements. The presence of cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The admixtures were compounded with the sodium phosphate added last after thorough mixing of all other components. The authors noted that this is not the preferred order of mixing (usually phosphate is added first and thoroughly mixed before adding calcium last); however, they believed this reversed order of mixing would provide a margin of error in cases in which the proper order is not followed. After compounding, the solutions were stored for 24 hours at 40 °C. The maximum calcium and phosphate amounts that could be mixed in the various solutions were reported tabularly and are shown in Table 1.<sup>(2039)</sup> However, these results are not entirely consistent with another study.<sup>(2196)</sup>

**Table 1. Maximum Amount of Phosphate (as Sodium) (mmol/L) Not Resulting in Precipitation.**<sup>2039</sup> See CAUTION below.<sup>a</sup>

Calcium (as Gluconate)	Amino Acid (as TrophAmine) plus Cysteine HCl 40 mg/g of Amino Acid				
	0%	0.4%	1%	2%	3%
9.8 mEq/L	0	27	42	60	66
14.7 mEq/L	0	15	18	30	36
19.6 mEq/L	0	6	15	27	30
29.4 mEq/L	0	3	6	21	24

<sup>a</sup>CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

Calcium phosphate precipitation phenomena was evaluated in a series of parenteral nutrition

admixtures composed of dextrose 22%, amino acids (FreAmine III) 2.7%, and fat emulsion (Abbott) 0, 1, and 3.2%. Incorporation of calcium gluconate 19 to 24 mEq/L and phosphate (as sodium) 22 to 28 mmol/L resulted in visible precipitation in the fat-free admixtures. New precipitate continued to form over 14 days, even after repeated filtrations of the solutions through 0.2- $\mu$ m filters. The presence of the amino acids increased calcium and phosphate solubility, compared with simple aqueous solutions. However, the incorporation of the fat emulsion did not result in a statistically significant increase in calcium and phosphate solubility. The authors noted that the kinetics of calcium phosphate precipitate formation do not appear to be entirely predictable; both transient and permanent precipitation can occur either during the compounding process or at some time afterward. Because calcium phosphate precipitation can be very dangerous clinically, the use of inline filters was recommended. The authors suggested that the filters should have a porosity appropriate to the parenteral nutrition admixture-1.2  $\mu$ m for fat-containing and 0.2 or 0.45  $\mu$ m for fat-free nutrition mixtures. <sup>(2061)</sup>

A 2-mL fluid barrier of dextrose 5% in a microbore retrograde infusion set failed to prevent precipitation when used between calcium gluconate 200 mg/2 mL and sodium phosphate 0.3 mmol/0.1 mL. <sup>(1385)</sup>

A 2-in-1 parenteral nutrition admixture with final concentrations of TrophAmine 0.5%, dextrose 5%, l-cysteine hydrochloride 40 mg/g of amino acids, calcium gluconate 60 mg/100 mL, and sodium phosphates 46.5 mg/mL was found to result in visible precipitation of calcium phosphate within 30 hours stored at 23 to 27 °C. Despite the presence of the acidifying l-cysteine hydrochloride, precipitation occurred at clinically utilized amounts of calcium and phosphates. <sup>(2622)</sup>

The presence of magnesium in solutions may also influence the reaction between calcium and phosphate, including the nature and extent of precipitation. <sup>(158) (159)</sup>

The interaction of calcium and phosphate in parenteral nutrition solutions is a complex phenomenon. Various factors have been identified as playing a role in the solubility or precipitation of a given combination, including <sup>(608) (609) (1042) (1063) (1427) (2778)</sup> :

1. Concentration of calcium
2. Salt form of calcium
3. Concentration of phosphate
4. Concentration of amino acids
5. Amino acids composition
6. Concentration of dextrose
7. Temperature of solution
8. pH of solution
9. Presence of other additives
10. Order of mixing

Enhanced precipitate formation would be expected from such factors as high concentrations of calcium and phosphate, increases in solution pH, decreased amino acid concentrations, increases in temperature, addition of calcium prior to phosphate, lengthy standing times or slow infusion rates, and use of calcium as the chloride salt. <sup>(854)</sup>

Sodium Phosphates - AHFS 40:12

## Somatropin - AHFS 68:28

**Products** — Somatropin derived from *Escherichia coli* is available in vials and cartridges in sizes ranging from 1.5 to 24 mg, depending on the specific product. Each milligram represents about three units of activity. The commercially available dosage forms are variable in components and concentrations; care should be taken to follow the directions for the specific product being used. Most products are supplied in dry form requiring reconstitution using a diluent that is supplied with the product. Manufacturers' specific reconstitution instructions for each product should be followed. For products in vials, the specified amount of the diluent is injected into the somatropin container, aiming the stream at the container wall. The drug is reconstituted by gentle swirling using a rotary motion for most products but vigorous swirling for two minutes for Nutropin Depot. Vial inversion is recommended for reconstitution of Norditropin. Shaking is not recommended for any product and may damage the product.<sup>(1)</sup>

Norditropin Cartridges and Nutropin AQ are available as liquid injections not requiring dilution for use.<sup>(1)</sup>

Somatropin derived from mammalian cells (Saizen; Serostim) is available in vials in varying sizes from 4 to 8.8 mg, depending on the specific product. The manufacturer's specific reconstitution instructions for each product using the diluents provided should be followed. The specified amount of the diluent is injected into the somatropin container, aiming the stream at the container wall. The drug is dissolved by gentle swirling using a rotary motion, *not* shaking. Shaking is not recommended for any product and may damage the protein.<sup>(1)</sup>

*pH* — The pH values cited by the manufacturers are as follows<sup>(1)</sup> :

<b>Products</b>	<b>pH</b>
Genotropin	about 6.7
Humatrope	about 7.5
Norditropin	about 7.3
Nutropin	about 7.4
Nutropin AQ	about 6.0
Saizen	6.5 to 8.5
Serostim	7.4 to 8.5

**Administration** — Somatropin products are usually administered by subcutaneous injection. Humatrope and Saizen may also be administered intramuscularly.<sup>(1)</sup>

**Stability** — Intact containers of somatropin products derived from *E. coli* should be stored under refrigeration and protected from freezing. Genotropin and Norditropin should also be protected from light during storage. Most somatropin products result in clear solutions when reconstituted correctly. Shaking may result in cloudiness, rendering the products unacceptable for use. Reconstituted Nutropin Depot is a thick, milky suspension.<sup>(1)</sup>

Stability after reconstitution is variable among the products and depends on whether a preservative-containing diluent is used. See Table 1. Unpreserved reconstituted products of Genotropin and Humatrope should be stored under refrigeration and used within 24 hours. Nutropin Depot suspension should be used immediately upon reconstitution, discarding any unused remainder. Products reconstituted with the specified preserved diluents are stable for longer periods. After reconstitution with the appropriate preserved diluent, Norditropin and Nutropin are stable for 14 days, Genotropin for 21 days, and Humatrope for 28 days stored under refrigeration. Nutropin AQ is stable for 28 days after initial stopper penetration when stored under refrigeration.<sup>(1)</sup>

Intact containers of somatropin products derived from mammalian cells should be stored at controlled room temperature. Saizen reconstituted with the preserved diluent provided is stable for

14 days after reconstitution when stored under refrigeration. Serostim reconstituted with the unpreserved diluent provided is stable for 24 hours stored under refrigeration. Freezing of reconstituted solutions should be avoided.<sup>(1)</sup>

**Table 1. Recommended Stability Periods for Somatropin Products Using Diluents with and without Preservatives and Stored under Refrigeration<sup>1</sup>**

Product	Stability Period
Diluent with Preservative	
Genotropin 5.8 and 13.8 mg	21 days
Humatrope	28 days
Norditropin	14 days
Nutropin	14 days
Nutropin AQ	28 days <sup>a</sup>
Saizen	14 days
Diluent without Preservative	
Genotropin 1.5 mg	24 hr
Humatrope	24 hr
Serostim	24 hr

<sup>a</sup>Period after initial penetration of the vial stopper of this liquid product.

*Syringes* — Somatropin (Humatrope) was reconstituted to concentrations of 1 and 3.33 mg/mL with the accompanying diluent; the diluent contains glycerin 1.7% and *m*-cresol 0.3% as a preservative. The reconstituted product at each concentration was packaged in 1-mL plastic syringes with barrels composed of polypropylene (Becton Dickinson) or propylene-ethylene copolymer (Terumo) and capped and stored under refrigeration at about 5 °C for 28 days. Little or no loss of somatropin occurred stored in either syringe. The solutions remained visually acceptable for 28 days in the polypropylene syringes, but an unacceptable turbidity formed within 21 days in the propylene-ethylene copolymer syringes, which became a precipitate by 28 days. The preservative, *m*-cresol, concentrations fell up to 4% but remained above the minimum acceptable concentration. Somatropin should be stored no more than 14 days at 5 °C in propylene-ethylene copolymer syringes. Storage up to 28 days was acceptable in the polypropylene syringes.<sup>(2210)</sup>

Somatropin - AHFS 68:28

## Sterile Water For Injection - AHFS 96:00

**Products** — Sterile water for injection is available in ampuls, vials, and plastic bags in sizes ranging from 5 mL to 5 L. This diluent is a pharmaceutical aid that contains no antimicrobial preservative or any other solute but must have drugs or other solutes added prior to administration. <sup>(1-2/08)</sup>

*pH* — From 5 to 7. <sup>(1-2/08)</sup> (17)

*Osmolality* — Sterile water for injection has an osmolality of 0 mOsm/kg. It is incompatible with blood and will cause hemolysis if administered intravenously in sufficient quantity. <sup>(1-2/08)</sup>

**Administration** — Sterile water for injection is intended for use as a pharmaceutical aid in dissolving or diluting drugs for subcutaneous, intramuscular, and intravenous injection. It must not be administered intravenously without the addition of a sufficient amount of drugs or other solutes to provide adequate osmolality to make the solution approximately isotonic. <sup>(1-2/08)</sup> Death and injury have resulted from hemolysis caused by intravenous administration of a sufficient volume of sterile water for injection and other low-osmolality solutions. <sup>(4)</sup> (1942) (2072) (2073) (2481) (2482)

For patient safety, medical orders for large volumes of sterile water for injection, especially plastic bags of any size, without the addition of sufficient drug or solute to render the solutions approximately isotonic (about 308 mOsm/kg) should not be permitted. Immediate consultation with the prescriber or referral to the institutional medical peer review process may be necessary to avoid possible patient harm. Large-volume containers of sterile water for injection should be stored only in pharmacies and not in patient care areas. Suitable warnings near the stored product and computer system alerts should remind staff that sterile water for injection is for diluent use only. <sup>(2481)</sup>

**Stability** — The intact single-use containers of sterile water for injection should be stored at controlled room temperature. <sup>(1-2/08)</sup>

Sterile Water For Injection - AHFS 96:00

## Streptomycin Sulfate - AHFS 8:12.02

**Products** — Streptomycin sulfate is available as a lyophilized powder for injection in vials containing 1 g of drug with no preservatives. Reconstitute with 4.2, 3.2, or 1.8 mL of sterile water for injection to yield solutions containing 200, 250, or 400 mg/mL, respectively.<sup>(4)</sup>

*pH* — The reconstituted injection at a concentration of 200 mg/mL has a pH of 4.5 to 7.<sup>(1-8/08)</sup> (4)

**Administration** — Streptomycin sulfate is administered by deep intramuscular injection well within the body of a relatively large muscle, such as the upper outer quadrant of the buttock in adults or the midlateral thigh in adults or children. Injection sites should be alternated.<sup>(1-8/08)</sup> (4) Intravenous injection is not recommended<sup>(4)</sup>, although it has been performed.<sup>(1603)</sup>

**Stability** — Intact vials of streptomycin sulfate lyophilized powder should be stored at controlled room temperature and protected from light.<sup>(1-8/08)</sup> (4)

Reconstituted solutions of streptomycin sulfate are stated to be stable for one week at room temperature and protected from light. However, no preservatives are present and the possibility of microbiological contamination must be considered.<sup>(1-8/08)</sup> (4)

Streptomycin Sulfate - AHFS 8:12.02

## Streptozocin - AHFS 10:00

**Products** — Streptozocin is available in single-dose vials containing 1 g of drug and 220 mg of citric acid anhydrous. Sodium hydroxide may have been used to adjust the pH. <sup>(1-5/07)</sup>

Reconstitute with 9.5 mL of sodium chloride 0.9% or dextrose 5% to provide a 100-mg/mL solution. <sup>(1-5/07)</sup> (4)

pH — From 3.5 to 4.5. <sup>(1-5/07)</sup>

**Trade Name(s)** — Zanosar

**Administration** — Streptozocin may be administered by rapid intravenous injection or intravenous infusion over 15 minutes to six hours. <sup>(1-5/07)</sup> (4)

**Stability** — Intact vials containing a pale yellow powder should be refrigerated and protected from light. <sup>(1-5/07)</sup> (4)

The pale gold reconstituted solution is stable for 48 hours at room temperature or 96 hours under refrigeration. <sup>(4)</sup> However, the manufacturer recommends use within 12 hours because the product does not contain an antibacterial preservative. <sup>(1-5/07)</sup> (4)

Streptozocin (Upjohn) 3 mg/mL in sodium chloride 0.9% did not support the growth of *Staphylococcus aureus*, *Enterococcus faecium*, *Pseudomonas aeruginosa*, and *Candida albicans* with loss of viability over 24 hours at room temperature. Even so, admixtures should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods. <sup>(2740)</sup>

**Filtration** — Streptozocin 10 to 200 mcg/mL exhibited no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters. <sup>(1415)</sup> <sup>(1416)</sup>

Streptozocin - AHFS 10:00

## Succinylcholine Chloride - AHFS 12:20.20

**Products** — Succinylcholine chloride is available in a concentration of 20 mg/mL in 5- and 10-mL multiple-dose vials and 5-mL syringes. The vials are preserved with parabens or benzyl alcohol and may contain sodium chloride for isotonicity and hydrochloric acid for pH adjustment. Succinylcholine chloride is also available in higher concentrations of 50 mg/mL in 10-mL ampuls and 100 mg/mL in 10-mL single-dose vials. <sup>(1-4/08)</sup> (4)

*pH* — From 3 to 4.5. <sup>(1-4/08)</sup> (4)

*Osmolality* — The osmolality of succinylcholine chloride 50 mg/mL was determined to be 409 mOsm/kg. <sup>(1233)</sup>

*Trade Name(s)* — Anectine, Quelicin

**Administration** — Succinylcholine chloride is usually administered by direct intermittent intravenous injection or intravenous infusion. For continuous intravenous infusion, a 1- to 2-mg/mL (0.1 to 0.2%) solution is prepared, usually in 250 to 1000 mL of compatible fluid. If necessary, when a suitable vein is inaccessible, a maximum of 150 mg of the drug may be administered by deep intramuscular injection, preferably high into the deltoid muscle. <sup>(1-4/08)</sup> (4)

**Stability** — Commercially available injections of succinylcholine chloride should be stored at 2 to 8 °C to retard loss. <sup>(1-4/08)</sup> (4) Succinylcholine chloride injection in the original unopened containers is stated in the labeling to be stable for 14 days at room temperature. <sup>(1-4/08)</sup> (1433)

Studies indicate that succinylcholine chloride injection in original unopened containers may be stable at room temperature for longer periods. The manufacturer of Quelicin has stated that the drug was stable for three months at temperatures up to 25 °C. <sup>(1239)</sup> <sup>(2745)</sup> More recently, Hospira has stated that Quelicin is stable only for 30 days at room temperature. <sup>(2783)</sup>

Research studies have also looked at the stability of succinylcholine chloride above refrigeration temperature. In one study, storage for seven days at 40 °C followed by storage at 25 °C for four weeks was used to simulate the worst case of shipping followed by storage on an emergency cart. Calculated loss at room temperature was 1%/week; at 40 °C, it was 3.2%/week. Therefore, the loss was estimated to be about 7% under such conditions. <sup>(960)</sup>

In another study, similar results were found. The decomposition rate of succinylcholine chloride was dependent on both concentration and temperature. The calculated degradation rates at room temperature were all higher for the 50-mg/mL concentration (2.1%/month) compared to the 20-mg/mL injection (1.2%/month). The time to 10% decomposition on an emergency cart was about 4.8 months for the 50-mg/mL concentration and was about 8.3 months for the 20-mg/mL concentration. Refrigeration cut the decomposition rates to 0.3 and 0.18% per month, respectively. <sup>(2742)</sup>

However, a somewhat shorter time to 10% decomposition at room temperature has also been reported. Commercial vials of succinylcholine chloride 20 mg/mL (Quelicin) stored at room temperature were found to decompose about 10 to 11% drug in 6 months. The authors recommended limiting room temperature storage to not more than 6 months. <sup>(2763)</sup>

After dilution of succinylcholine chloride to a concentration of 1 or 2 mg/mL in sodium chloride 0.9%, the drug is stated to be chemically stable for four weeks at 5 °C and one week at 25 °C. However, use within 24 hours of preparation is recommended along with discarding any unused solution. <sup>(1-4/08)</sup> (4)

*pH Effects* — Succinylcholine chloride is unstable in alkaline solutions <sup>(1-4/08)</sup> (4) and decomposes in

solutions with a pH greater than 4.5.<sup>(4)</sup> The pH of maximum stability was found to be 3.75 to 4.50.<sup>(960)</sup>

In combination with barbiturates, either free barbituric acid will precipitate or the succinylcholine chloride will be hydrolyzed, depending on the final pH of the admixture.<sup>(1-4/08)</sup> (4) (21)  
Succinylcholine chloride should not be mixed with barbiturates in the same syringe or given simultaneously through the same needle.<sup>(1-4/08)</sup>

*Syringes* — Succinylcholine chloride (Abbott) 20 mg/mL was packaged in both glass and polypropylene syringes (Becton Dickinson) sealed with rubber luer-tip caps (Becton Dickinson). The syringes were stored for 45 days at 4 °C, 22 °C and 50% relative humidity, and 37 °C and 85% relative humidity. At 4 °C, there was little or no succinylcholine chloride loss after 45 days in either glass or plastic syringes. At 22 °C and 50% relative humidity, about a 5% loss occurred in 45 days. However, at 37 °C and 85% relative humidity, the drug concentration fell below the acceptable USP limit after about 30 days.<sup>(1209)</sup>

Succinylcholine chloride (Burroughs Wellcome) 20 mg/mL in dextrose 5% and in sodium chloride 0.9% (Baxter) was packaged as 10 mL in 12-mL plastic syringes (Monoject) and wrapped in aluminum foil. Little or no loss of succinylcholine chloride occurred during 107 days of storage at 5 °C. At 25 °C, about 5 to 6% loss occurred in 100 days. Samples at an elevated temperature of 40 °C were stable through 22 days with only 3 to 4% loss but exhibited 12 to 14% loss at 63 days.<sup>(1892)</sup>

Succinylcholine chloride (Abbott) 20 mg/mL was packaged as 8 mL of undiluted injection in 12-mL polypropylene syringes (Becton Dickinson) and was stored at 4 °C and 25 °C exposed to fluorescent light. The injection remained visually clear at both temperatures. Little or no loss of succinylcholine chloride occurred in 90 days when stored at 4 °C. However, at 25 °C losses of about 6, 10, and 12% occurred in 45, 60, and 90 days, respectively.<sup>(2438)</sup>

Syringes prefilled with succinylcholine chloride injection for emergency use have been reported to freeze upon storage under refrigeration. Care should be taken to make sure that refrigerators are operating within compendial temperature ranges to ensure the availability of stored drugs in emergencies.<sup>(2698)</sup> (2699)

Succinylcholine Chloride - AHFS 12:20.20

## Sumatriptan Succinate - AHFS 28:32.28

**Products** — Sumatriptan succinate is available at a concentration of 6 mg/0.5 mL with sodium chloride 3.5 mg/0.5 mL in water for injection in single-dose vials and prefilled syringes. The drug is also available at a concentration of 4 mg/0.5 mL with sodium chloride 3.8 mg/0.5 mL in water for injection in prefilled syringes. <sup>(1-11/06)</sup>

*pH* — Approximately 4.2 to 5.3. <sup>(1-11/06)</sup>

*Osmolality* — The solution is nearly isotonic with an osmolality of 291 mOsm/kg. <sup>(1-11/06)</sup>

*Trade Name(s)* — Imitrex

**Administration** — Sumatriptan succinate is administered subcutaneously. It should not be given by other routes of administration. <sup>(1-11/06)</sup>

**Stability** — Intact containers of sumatriptan succinate should be stored between 2 and 30 °C and protected from light. The injection is a clear, colorless to light yellow solution. <sup>(1-11/06)</sup>

*Syringes* — The stability of sumatriptan succinate (Glaxo Wellcome) 12 mg/mL packaged as 1 mL of solution drawn into 1-mL polypropylene tuberculin syringes was evaluated stored under refrigeration and at room temperature of 25 °C both exposed to and protected from fluorescent light. The room temperature samples were evaluated over 24 hours while the refrigerated samples were evaluated over 72 hours. No visible indications of physical instability were observed, and no loss of sumatriptan was found. <sup>(2276)</sup>

    - Sumatriptan Succinate - AHFS 28:32.28

## Tacrolimus - AHFS 92:44

**Products** — Tacrolimus injection is available in 1-mL ampuls containing the equivalent of 5 mg of anhydrous tacrolimus per milliliter. In addition to tacrolimus, each milliliter contains polyoxyl 60 hydrogenated castor oil (surfactant) 200 mg and dehydrated alcohol, USP, 80% (v/v). The product is a concentrate that must be diluted for use in dextrose 5% or sodium chloride 0.9%. <sup>(1-5/09)</sup>

*Trade Name(s)* — Prograf

**Administration** — Tacrolimus is administered by intravenous infusion diluted to a final concentration of 0.004 to 0.02 mg/mL (4 to 20 mcg/mL) in dextrose 5% or sodium chloride 0.9%. Intravenous solution containers should be made of glass or polyethylene; PVC containers plasticized with diethylhexyl phthalate (DEHP) should be avoided due to leaching of plasticizer and decreased stability. For dilute solutions of tacrolimus, non-PVC tubing should also be used to minimize the potential for significant drug sorption. <sup>(1-5/09)</sup>

**Stability** — Intact ampuls should be stored at temperatures between 5 and 25 °C. <sup>(1-5/09)</sup> Tacrolimus exhibits a minimum rate of decomposition at pH values between 2 and 6; the rate of decomposition increases substantially at higher pH values <sup>(1926)</sup> and is unstable above pH 9. <sup>(2216)</sup> The manufacturer recommends that tacrolimus not be mixed with or even co-infused with solutions having a pH of 9 or greater. <sup>(1-5/09)</sup>

*Syringes* — Tacrolimus (Fujisawa) 100 mcg/mL in sodium chloride 0.9% was packaged 20 mL in 30-mL plastic syringes (Becton Dickinson) and stored at 24 °C exposed to normal room light and protected from light. No decrease in tacrolimus concentration was found after storage for 24 hours. <sup>(1864)</sup>

*Sorption* — Tacrolimus (Fujisawa) 100 mcg/mL in dextrose 5% was delivered through PVC anesthesia extension tubing (Abbott), PVC intravenous administration set tubing (Venoset, Abbott), and fat emulsion tubing (Abbott). The delivered solutions had no loss of tacrolimus using the PVC administration set tubing and the fat emulsion tubing and only 2.5% drug loss from the PVC anesthesia extension tubing. <sup>(1864)</sup>

Tacrolimus 50 mcg/mL delivered through 100 cm of PVC tubing at a rate of 5 mL/hr resulted in the delivery of 76% of the tacrolimus concentration. No loss due to sorption occurred when the tacrolimus solution was delivered through polyolefin tubing. <sup>(2452)</sup>

*Plasticizer Leaching* — Parenteral products containing a large amount of surfactant in the formulation such as tacrolimus injection will extract the plasticizer DEHP from PVC containers and administration sets. Consequently, their use should be avoided for tacrolimus. Instead, glass or polyethylene containers and non-DEHP plasticized administration sets are recommended. <sup>(1-5/09)</sup> (4) <sup>(1683)</sup>

Tacrolimus 50 mcg/mL delivered through 100 cm of PVC tubing at a rate of 5 mL/hr leached 12 mcg/mL of DEHP into the drug solution. No plasticizer leached when the tacrolimus solution was delivered through similar polyolefin tubing. <sup>(2452)</sup>

Tacrolimus 0.02 mg/mL in dextrose 5% in VISIV polyolefin bags was tested at room temperature near 23 °C for 24 hours. No leached plastic components were found within the 24-hour study period. <sup>(2660)</sup> <sup>(2792)</sup>

### Compatibility Information

#### Solution Compatibility

#### Tacrolimus

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
----------	-----	-----	--------	---------	-----	-----

Dextrose 5%		4 to 20 mg		Stable for 24 hr	<a href="#">1(5/09)</a>	C

## Teicoplanin - AHFS 8:12.28.16

**Products** — Teicoplanin is available as a lyophilized powder in vials containing teicoplanin 200 and 400 mg. The vials are accompanied by an ampul of water for injection for use as a diluent. Reconstitute by adding the diluent slowly down the side of the vial of teicoplanin and then rolling the vial gently until the powder is completely dissolved. Do not shake the vial. Care should be taken to avoid the formation of foam; if foam does form, the solution should stand for about 15 minutes for the foam to subside. The teicoplanin vials contain a calculated excess so that when reconstituted as directed the full amount of drug can be withdrawn from the vial using a syringe and needle. The concentration is 100 mg in 1.5 mL (from the 200-mg vials) and 400 mg in 3 mL (from the 400-mg vial).<sup>(38) (115)</sup>

**Trade Name(s)** — Targocid

**Administration** — Teicoplanin may be administered after reconstitution either intramuscularly with a maximum of 3 mL in a single site or by direct intravenous injection as a bolus over 3 to 5 minutes. It may also be administered as an intravenous infusion over 30 minutes after dilution in a compatible infusion solution. The manufacturer recommends dextrose 5%, dextrose 4% and sodium chloride 0.18%, Ringer's injection, lactated, and sodium chloride 0.9% for dilution for intravenous infusion.<sup>(38) (115)</sup>

**Stability** — Intact vials of teicoplanin should be stored below 25 °C. The manufacturer recommends that reconstituted teicoplanin be used immediately after preparation and any unused portion be discarded. However, the manufacturer also states that the reconstituted solution may be stored under refrigeration at 4 °C for up to 24 hours if the situation makes discarding the reconstituted drug impractical. Do not store in syringes.<sup>(38) (115)</sup>

Teicoplanin forms dextrose aldehyde adducts when diluted in dextrose-containing solutions. Equilibrium is reached faster at room temperature (seven days) than with refrigerated storage (30 days). The equilibrium concentration of the adduct is directly related to the dextrose concentration. The reaction is reversible with dilution.<sup>(2046)</sup>

The stability of catheter flush solutions composed of teicoplanin 133 mg/mL in water for injection, or heparin sodium 10 units/mL or 100 units/mL, was evaluated in Hickman catheters at 25 °C over 24 hours. No decomposition products formed, and no loss was found. Indeed, a small (11%) increase in teicoplanin concentration was observed which was attributed to loss of water.<sup>(2165)</sup>

The manufacturer recommends use of peritoneal dialysis solutions containing 1.36 or 3.86% dextrose.<sup>(38)</sup>

Teicoplanin (Marion Merrell Dow) 0.025 mg/mL in Dianeal PD-2 with dextrose 1.5% in PVC containers was physically and chemically stable for 24 hours at 25 °C exposed to light, exhibiting no loss; additional storage for eight hours at 37 °C resulted in losses of 6% or less. Under refrigeration at 4 °C protected from light, no loss occurred in seven days. Additional storage for 16 hours at 25 °C followed by eight hours at 37 °C resulted in about 7% loss.<sup>(1989)</sup>

Ceftazidime (Glaxo) 0.1 mg/mL admixed with teicoplanin (Marion Merrell Dow) 0.025 mg/mL in Dianeal PD-2 with dextrose 1.5% in PVC containers did not result in a stable mixture. Large (but variable) teicoplanin losses generally in the 20% range were noted in as little as two hours at 25 °C exposed to light. Ceftazidime losses of about 9% occurred in 16 hours. Refrigeration and protection from light of the peritoneal dialysis admixture reduced losses of both drugs to negligible levels. Even so, admixing these two drugs was not recommended because of the high levels of teicoplanin loss at room temperature.<sup>(1989)</sup>

Teicoplanin (Merrell Dow) 25 mg/L in Dianeal 137 with dextrose 1.36% (Baxter) was evaluated for stability over 42 days. Stored at 4 °C, teicoplanin retained stability with a loss of less than 5% in 42

days. At 20 °C, 10% loss occurred in about 25 days with 17% loss in 42 days. At an elevated temperature of 37 °C, a much greater rate of decomposition occurs with over 40% loss occurring in 42 days.<sup>(2145)</sup>

## Telavancin Hydrochloride - AHFS 8:12.28.16

**Products** — Telavancin hydrochloride is available as a lyophilized powder in single-use vials containing telavancin 250 and 750 mg as the hydrochloride.<sup>(2831)</sup> Also present are hydroxypropyl-beta-cyclodextrin, mannitol, and sodium hydroxide and hydrochloric acid to adjust pH.<sup>(2831)</sup>

The 250-mg vial should be reconstituted with 15 mL and the 750-mg vial with 45 mL of dextrose 5%, sterile water for injection, or sodium chloride 0.9% and mixed thoroughly to yield a telavancin concentration of 15 mg/mL.<sup>(2831)</sup> Dissolution may occasionally require up to 20 minutes.<sup>(2831)</sup> Any vial that does not have a vacuum should be discarded.<sup>(2831)</sup>

*pH* — From 4.0 to 5.0.<sup>(2831)</sup>

*Trade Name(s)* — Vibativ

**Administration** — Telavancin hydrochloride is administered by intravenous infusion over 60 minutes after dilution in a compatible infusion solution.<sup>(2831)</sup> For telavancin doses of 150 to 800 mg, dilution in 100 to 250 mL is recommended.<sup>(2831)</sup> For doses outside this range, dilution to a concentration of 0.6 to 8 mg/mL is recommended.<sup>(2831)</sup> The manufacturer recommends dilution in dextrose 5%, sodium chloride 0.9%, or Ringer's injection, lactated.<sup>(2831)</sup>

**Stability** — Intact vials of telavancin hydrochloride should be stored under refrigeration.<sup>(2831)</sup> The manufacturer recommends that the reconstituted drug should be used within four hours at room temperature or 72 hours under refrigeration.<sup>(2831)</sup> After dilution in a compatible infusion solution, the total time for the reconstituted drug and the diluted solution together should not exceed four hours at room temperature or 72 hours under refrigeration.<sup>(2831)</sup>

**Telavancin Hydrochloride - AHFS 8:12.28.16**

## Teniposide (VM-26) - AHFS 10:00

**Products** — Teniposide is available in 5-mL ampuls containing 50 mg of drug. Each milliliter of solution contains teniposide 10 mg, benzyl alcohol 30 mg, *N,N*-dimethylacetamide 60 mg, polyoxyethylated castor oil (Cremophor EL) 500 mg, and dehydrated alcohol 42.7% (v/v). The pH is adjusted with maleic acid. The product is a concentrate that must be diluted for use. <sup>(1-6/06)</sup>

*pH* — Approximately 5. <sup>(1-6/06)</sup>

*Trade Name(s)* — Vumon

**Administration** — Teniposide is administered by slow intravenous infusion over at least 30 to 60 minutes after dilution in dextrose 5% or sodium chloride 0.9% to a final concentration of 0.1, 0.2, 0.4, or 1 mg/mL. <sup>(1-6/06)</sup> Extended infusions of 0.1- and 0.2-mg/mL solutions over 24 hours have resulted in precipitation. <sup>(1-6/06)</sup> <sup>(1502)</sup> <sup>(1521)</sup> The intravenous solution containers and sets used to administer teniposide should not contain the plasticizer diethylhexyl phthalate (DEHP). Extravasation should be avoided because of local tissue irritation and phlebitis. <sup>(1-6/06)</sup> <sup>(4)</sup>

Heparin sodium can cause precipitation of teniposide. Administration apparatus should be thoroughly flushed before and after teniposide administration with dextrose 5% or sodium chloride 0.9%. <sup>(1-6/06)</sup> <sup>(1502)</sup>

Contact of the undiluted teniposide concentrate with plastic equipment and devices during preparation has resulted in softening of the plastic, cracking, and leakage. Damage to plastic equipment has not been reported with diluted solutions. <sup>(1-6/06)</sup>

**Stability** — The teniposide concentrate is clear <sup>(1-6/06)</sup> but may exhibit a slight opalescence when diluted in infusion solutions due to the surfactant content. <sup>(234)</sup>

Intact ampuls should be stored under refrigeration in the original package to protect from light. Teniposide stability is not adversely affected by freezing <sup>(1-6/06)</sup> or exposure to normal room fluorescent light during administration. <sup>(1374)</sup>

The manufacturer does not recommend refrigeration of teniposide diluted in infusion solutions. <sup>(1-6/06)</sup>

**Precipitation** — Although teniposide is chemically stable for at least 24 hours, precipitation from aqueous solutions has occurred irregularly and unpredictably even at 0.1 and 0.2 mg/mL, the lowest recommended concentrations. <sup>(1-6/06)</sup> <sup>(1502)</sup> <sup>(1521)</sup> The precipitation rate depends on the formation of crystallization nuclei. Precipitation then proceeds rapidly. The formation of crystallization nuclei may be accelerated by agitation, contact with incompatible drugs or material surfaces, and, possibly, other factors. <sup>(1374)</sup> <sup>(1502)</sup> <sup>(1521)</sup> The manufacturer recommends avoiding an inordinate amount of agitation during preparation, minimizing storage time prior to administration, and avoiding contact with other drugs and solutions. Even the compatibility of teniposide infusions with some infusion set materials and pumps cannot be assured. <sup>(1-6/06)</sup> <sup>(1502)</sup> <sup>(1521)</sup>

**Sorption** — No teniposide loss due to sorption to PVC containers has been observed. <sup>(1374)</sup> <sup>(2053)</sup>

**Plasticizer Leaching** — The surfactant, Cremophor EL, in the teniposide formulation leaches the plasticizer DEHP from PVC containers and sets. The amount leached increases with time and drug concentration and is similar for sodium chloride 0.9% and dextrose 5%. The use of non-PVC containers, such as glass bottles and polyolefin bags, and non-PVC administration sets, such as lipid administration sets and nitroglycerin sets, is recommended. <sup>(1-6/06)</sup>

Teniposide (Bristol) 0.1 mg/mL in dextrose 5% leached relatively large amounts of DEHP from PVC

bags due to the Cremophor EL surfactant in the formulation. After eight hours at 24 °C, the DEHP concentration in 50-mL bags of infusion solution was as much as 7.5 mcg/mL; it continued to increase through 24 hours to 22.2 mcg/mL. This finding is consistent with the surfactant concentration (1%) of the final admixture solution. The actual amount of DEHP leached from PVC containers and administration sets may vary in clinical situations, depending on surfactant concentration, bag size, and contact time. <sup>(1683)</sup>

Substantial leaching of DEHP plasticizer was reported from PVC bags of dextrose 5% and sodium chloride 0.9% and PVC administration sets by teniposide admixtures containing 0.4 mg/mL of the drug due to the Cremophor EL surfactant used in the formulation. DEHP levels increased throughout the one-hour infusion time to over 20 mcg/mL from both the bags and sets. There was no difference in plasticizer leaching between the two infusion solutions. Storage of the teniposide 0.4-mg/mL admixtures for 48 hours at both 4 and 24 °C resulted in substantially greater DEHP leaching. DEHP concentrations ranged from about 60 mcg/mL in the refrigerated samples to over 200 mcg/mL (a total of 52 mg) in the room temperature samples. The actual amount of DEHP a patient will receive is dependent on a number of factors, including Cremophor EL concentration, storage temperature, and contact time. No plasticizer was leached from glass bottles or polyolefin infusion containers. To minimize plasticizer leaching if PVC containers and sets must be used, it is recommended that teniposide admixtures be used immediately after preparation and administered over no more than one hour. <sup>(2053)</sup>

An acceptability limit of no more than 5 parts per million (5 mcg/mL) for DEHP plasticizer released from PVC containers, administration sets, and other equipment has been proposed. The limit was based on a review of metabolic and toxicologic considerations. <sup>(2185)</sup>

Teniposide 0.1 mg/mL in dextrose 5% in VISIV polyolefin bags was tested at room temperature near 23 °C for 24 hours. No leached plastic components were found within the 24-hour study period. <sup>(2660)</sup> <sup>(2792)</sup>

Teniposide (VM-26) - AHFS 10:00

## Tenoxicam - AHFS 28:08.04

**Products** — Tenoxicam is available as a lyophilized powder for injection in vials containing 20 and 40 mg of drug. Also present in the vials are mannitol, ascorbic acid, disodium edetate, tromethamine, and sodium hydroxide or hydrochloric acid. The lyophilized powder should be reconstituted using the 2-mL ampuls of sterile water for injection provided for that purpose.<sup>(38)</sup> <sup>(115)</sup>

**Trade Name(s)** — Mobiflex, Tilcotil

**Administration** — Tenoxicam is administered by intramuscular<sup>(38)</sup> <sup>(115)</sup> or intravenous bolus injection.<sup>(38)</sup> <sup>(115)</sup> Addition to infusion solutions is not recommended.<sup>(38)</sup> <sup>(115)</sup>

**Stability** — The greenish-yellow lyophilized powder in intact vials should be stored at controlled room temperature at or below 25 °C (38) to 30 °C (115) and protected from freezing. The drug is stable for 24 hours after reconstitution, but administration immediately after preparation is recommended. It should not be added to infusion solutions because of the possibility of precipitation.<sup>(38)</sup> <sup>(115)</sup>

Tenoxicam - AHFS 28:08.04

## Tetracaine Hydrochloride - AHFS 72:00

**Products** — Tetracaine hydrochloride is available as a preservative-free solution in a concentration of 10 mg/mL (1%) in 2-mL ampules. The product also contains sodium chloride and hydrochloric acid and/or sodium hydroxide to adjust pH in water for injection. <sup>(1-4/06)</sup>

Pontocaine brand of tetracaine hydrochloride 10 mg/mL also contains acetone sodium bisulfite. <sup>(4)</sup>

Tetracaine hydrochloride hyperbaric solutions are available in concentrations of 0.2 and 0.3% in dextrose 6%. <sup>(4)</sup>

*pH* — Tetracaine hydrochloride injection has a pH ranging from 3.2 to 6.0. <sup>(1-4/06)</sup> Reconstituted tetracaine hydrochloride powder has a pH ranging from 5 to 6 after reconstitution. <sup>(4)</sup>

*Osmolality* — Tetracaine hydrochloride 10-mg/mL injection is isotonic. <sup>(1-4/06)</sup>

*Trade Name(s)* — Pontocaine Hydrochloride

**Administration** — Tetracaine hydrochloride injection is used for prolonged spinal anesthesia. The injection is isobaric having a specific gravity of 1.0060 to 1.0074 at 25 °C, which is very similar to spinal fluid. A hyperbaric solution of tetracaine hydrochloride may be prepared by diluting the 10-mg/mL injection in dextrose 10%. <sup>(1-4/06)</sup> <sup>(4)</sup>

Tetracaine hydrochloride powder for injection dissolved in spinal fluid is slightly hyperbaric. A hypobaric solution with a specific gravity of 1.000 at 25 °C may be prepared by dissolving the tetracaine hydrochloride powder in sterile water for injection at a concentration of 0.1%. A hyperbaric solution of tetracaine hydrochloride may be prepared by dissolving the powder in dextrose 10% to yield a 10-mg/mL solution. The resulting solution is further diluted with an equal volume of cerebrospinal fluid to yield 5 mg/mL of tetracaine hydrochloride and dextrose. <sup>(4)</sup>

**Stability** — Tetracaine hydrochloride injection in intact vials should be stored under refrigeration and protected from light. Freezing should be avoided. The injection should not be used if crystals, cloudiness, or discoloration is present. <sup>(1-4/06)</sup> <sup>(4)</sup>

Tetracaine hydrochloride 10-mg/mL injection and tetracaine hydrochloride powder in intact containers can be autoclaved at 121 °C for 15 minutes to sterilize the exterior of the ampuls. However, autoclaving may increase the occurrence of crystal formation. Ampuls that have been autoclaved but are not used must be discarded and may not be returned to stock. <sup>(1-4/06)</sup> <sup>(4)</sup>

Tetracaine hydrochloride in aqueous solutions undergoes hydrolysis slowly that results in the formation of *p*-butylaminobenzoic acid crystals. Solutions containing crystals should not be used. <sup>(4)</sup>

Tetracaine hydrochloride stability in aqueous solution was evaluated. Accelerated degradation at elevated temperatures led to a determination that tetracaine hydrochloride in aqueous solution was stable for at least 12 months at 25 °C with about 96% remaining. After two years, the concentration had declined to about 89%. <sup>(2453)</sup> When stored under refrigeration at 4 to 6 °C, no loss of tetracaine hydrochloride was detected after 365 days of storage. <sup>(2705)</sup>

*pH Effects* — Tetracaine hydrochloride is unstable in both acidic and alkaline media. The pH of maximum stability was found to be 3.8. <sup>(2666)</sup> <sup>(2705)</sup> Tetracaine hydrochloride mixed with alkali hydroxides or carbonates results in the precipitation of tetracaine base as an oily liquid. <sup>(4)</sup>

Tetracaine Hydrochloride - AHFS 72:00

## Theophylline - AHFS 86:16

**Products** — Theophylline is available, premixed in dextrose 5%, in concentrations from 0.8 to 4 mg/mL (expressed as anhydrous theophylline).<sup>(1-7/08)</sup>

*pH* — From 3.5 to 6.5.<sup>(1-7/08)</sup>

*Osmolality* — Theophylline premixed in dextrose 5% products have osmolalities in the range of 255 to 275 mOsm/kg.<sup>(1-7/08)</sup>

**Administration** — Theophylline may be administered by continuous or intermittent intravenous infusion. Slow administration, not exceeding 20 mg/min, has been recommended. Loading doses are usually given over 20 to 30 minutes.<sup>(1-7/08)</sup>

**Stability** — Theophylline injection should be stored at controlled room temperature and protected from freezing. Avoid excessive heat.<sup>(1-7/08)</sup>

At a concentration of 1 g/L in dextrose 5%, theophylline was stable during autoclaving for 20 minutes at 120 °C. No decrease in the theophylline content was detected.<sup>(1173)</sup>

### Compatibility Information

#### Additive Compatibility

#### Theophylline

Drug	Mfr	Conc/L	Mfr	Conc/L	Test Soln	Remarks	Ref	C/I
Ascorbic acid		1.9 g		2 g	D5W	Yellow discoloration. 8% ascorbic acid loss in 6 hr and 15% in 24 hr. No theophylline loss	<a href="#">1909</a>	I
Cefepime HCl	BR	4 g	BA	800 mg	D5W	Visually compatible. 3% cefepime loss in 24 hr at room temperature and 7 days at 5 °C. No theophylline loss	<a href="#">1681</a>	C
Ceftriaxone sodium	RC	40 g	BA <sup>a</sup>	4 g		Yellow color forms immediately. 14% ceftriaxone loss and no theophylline loss in 24 hr	<a href="#">1727</a>	I
Chlorpromazine HCl		200 mg		2 g	D5W	Visually compatible. 7% chlorpromazine and no theophylline loss in 48 hr	<a href="#">1909</a>	C
Fluconazole	PF	1 g	BA	0.4 g	D5W	Fluconazole stable for 72 hr at 25 °C in fluorescent light. Theophylline not tested	<a href="#">1676</a>	C
Furosemide		330 mg		2 g	D5W	Visually compatible. Little theophylline and 10% furosemide loss in 48 hr	<a href="#">1909</a>	C
Lidocaine HCl		380 mg		2 g	D5W	Visually compatible with little or no loss of either drug in 48 hr	<a href="#">1909</a>	C
Methylprednisolone sodium succinate	UP	500 mg and 2 g	AB	4 g	D5W	Physically compatible. Little theophylline or methylprednisolone alcohol	<a href="#">1150</a>	C

Methylprednisolone sodium succinate	UP	500 mg and 2 g	AB	400 mg	D5W	loss in 24 hr at room temperature, but 8% ester hydrolysis Physically compatible. Little theophylline or methylprednisolone alcohol loss in 24 hr at room temperature, but 11% ester hydrolysis	<a href="#">1150</a>	C
Papaverine HCl		160 mg		2 g	D5W	Visually compatible with little or no loss of either drug in 48 hr	<a href="#">1909</a>	C
Verapamil HCl	KN	100 and 400 mg	AB	400 mg and 4 g	D5W	Physically compatible. Little loss of either drug in 24 hr at 24 °C in light	<a href="#">1172</a>	C

<sup>a</sup>Tested in PVC containers.

Theophylline - AHFS 86:16

## Thiamine Hydrochloride - AHFS 88:08

**Products** — Thiamine hydrochloride is available in a concentration of 100 mg/mL in 1- and 2-mL vials. Each milliliter of solution may also contain chlorobutanol 0.5% as an antibacterial preservative and monothioglycerol 0.5%. Sodium hydroxide and/or hydrochloric acid may be added to adjust the pH. <sup>(1-6/06)</sup> (4)

*pH* — From 2.5 to 4.5. <sup>(1-6/06)</sup> (17)

**Administration** — Thiamine hydrochloride injection may be administered by intramuscular or slow intravenous injection. An intradermal test dose has been recommended for patients with suspected thiamine sensitivity. <sup>(1-6/06)</sup> (4)

**Stability** — Thiamine hydrochloride in intact containers should be stored at controlled room temperature and protected from light and freezing. <sup>(1-6/06)</sup> (4)

Thiamine hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38 °C over four weeks. Analysis found no loss of the drug under these conditions. <sup>(2562)</sup>

Thiamine hydrochloride is stated to be incompatible with oxidizing and reducing agents. <sup>(4)</sup> In solutions with sulfites or bisulfites, it is rapidly inactivated. <sup>(52)</sup> (1072) (1925) Oxidation of thiamine hydrochloride results in the formation of the highly blue-colored and biologically inactive compound thiochrome. <sup>(734)</sup> (1072)

*pH Effects* — Thiamine hydrochloride is stable in acid solutions, losing activity very slowly at pH 4 or less. It is maximally stable at pH 2. <sup>(1072)</sup> Thiamine hydrochloride is unstable in neutral or alkaline solutions. <sup>(1-6/06)</sup> (4) (1072)

*Syringes* — Thiamine hydrochloride (Lilly) 100 mg/mL was repackaged in glass syringes (Glaspak), back-fill glass syringes (Hy-Pod), and plastic syringes (Stylex). Half of the syringes were filled with thiamine hydrochloride injection filtered through 5- $\mu$ m stainless steel depth filters (Extemp filter pin), and the rest were filled with unfiltered drug. The syringes containing 1 mL of thiamine hydrochloride injection were stored protected from light (amber UV-light-inhibiting plastic bags) at 22 to 24 °C for 84 days. No color changes were observed, and changes in pH were minimal. Furthermore, no differences between filtered or unfiltered samples occurred, with all solutions retaining approximately 100% over the 84 days. <sup>(734)</sup>

*Sorption* — Thiamine hydrochloride (Merck) 30 mg/L did not display significant sorption to a PVC plastic test strip in 24 hours. <sup>(12)</sup>

### Additional Compatibility Information

*Parenteral Nutrition Solutions* — The stability of thiamine hydrochloride 50 mg/L was studied in representative parenteral nutrition solutions exposed to fluorescent light, indirect sunlight, and direct sunlight for eight hours. One 5-mL vial of multivitamin concentrate (Lyphomed) containing 50 mg of thiamine hydrochloride and also 1 mg of folic acid (Lederle) were added to a liter of parenteral nutrition solution composed of amino acids 4.25%-dextrose 25% (Travenol) with standard electrolytes and trace elements. Thiamine hydrochloride was stable over the eight-hour study period at room temperature under fluorescent light and indirect sunlight, but direct sunlight caused a 26% loss. <sup>(842)</sup>

A 50% initial drop in thiamine concentration immediately after admixture of multivitamins in a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, and trace elements in PVC bags was reported. The thiamine concentration then remained relatively constant for 120 hours when stored at both 4 and 25 °C. <sup>(1063)</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8 °C for 96 hours with no significant loss of thiamine mononitrate. <sup>(1225)</sup>

The stability of several vitamins from M.V.I.-12 (Armour) admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, when stored in glass bottles and PVC bags at 25 and 5 °C for 48 hours was reported. Thiamine hydrochloride was stable in the parenteral nutrition solutions prepared with amino acid products without bisulfite. <sup>(1431)</sup>

The stability of several vitamins following admixture (as M.V.I-12) with four different amino acid products (Novamine, Neopham, FreAmine III, Travasol) with or without Intralipid when stored in glass bottles or PVC bags at 25 °C for 48 hours was reported. Exposure to high intensity phototherapy light did not affect thiamine. <sup>(487)</sup>

The stability of thiamine hydrochloride from a multiple vitamin product in dextrose 5% and sodium chloride 0.9% in PVC and ClearFlex containers was evaluated. Thiamine hydrochloride was stable at 23 °C when exposed to or protected from light, exhibiting losses of 11% or less in 24 hours. <sup>(1509)</sup>

The degradation of vitamins A, B<sub>1</sub>, C, and E from Cernevit (Roche) multivitamins in NuTRIflex Lipid Plus (B. Braun) admixtures prepared in ethylene vinyl acetate (EVA) bags and in multilayer bags was evaluated. After storage for up to 72 hours at 4, 21, and 40 °C, greater vitamin losses occurred in the EVA bags. Thiamine hydrochloride losses were 25%. In the multilayer bags (presumably a better barrier to oxygen transfer), losses were less. Thiamine hydrochloride losses were 10%. <sup>(2618)</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the other vitamins, including thiamine hydrochloride, retained their initial concentrations. <sup>(2796)</sup>

Thiamine Hydrochloride - AHFS 88:08

## Thiotepa - AHFS 10:00

**Products** — Thiotepa is available in vials containing 15 mg of drug and sodium carbonate 0.03 mg as a lyophilized powder. Reconstitute the vials with 1.5 mL of sterile water for injection. The withdrawable volume is about 1.4 mL. Because of a small excess of drug, the reconstituted solution contains thiotepa 10.4 mg/mL, yielding a withdrawable amount of approximately 14.7 mg from each vial.<sup>(1-10/06)</sup>

*pH* — Approximately 5.5 to 7.5.<sup>(1-10/06)</sup>

*Tonicity* — Reconstitution with sterile water for injection results in a hypotonic solution; it should be diluted in sodium chloride 0.9% prior to use.<sup>(1-10/06)</sup> Reconstitution with other diluents may result in a hypertonic solution which can cause mild to moderate discomfort upon administration.<sup>(4)</sup>

Thiotepa concentrations, 0.5 and 1 mg/mL diluted in sodium chloride 0.9%, are nearly isotonic, having osmolalities of 277 and 269 mOsm/kg, respectively. However, thiotepa concentrations of 3 and 5 mg/mL in sodium chloride 0.9% are hypotonic.<sup>(2006)</sup>

*Trade Name(s)* — Thioplex

**Administration** — Thiotepa is usually given by rapid intravenous administration but may also be given by the intracavitary or intravesical route.<sup>(1-10/06)</sup> <sup>(4)</sup> The drug has also been given by intramuscular, intrathecal, and intratumoral administration.<sup>(4)</sup>

**Stability** — Intact vials should be stored under refrigeration and protected from light at all times. Reconstituted solutions should be stored under refrigeration and protected from light until used.<sup>(1-10/06)</sup> <sup>(4)</sup> The reconstituted solution in sterile water for injection is stated to be stable for up to 28 days stored under refrigeration or frozen and seven days at room temperature.<sup>(1369)</sup> However, the manufacturer recommends storage under refrigeration and use within eight hours because of the absence of an antimicrobial preservative.<sup>(1-10/06)</sup> <sup>(4)</sup> Thiotepa may undergo polymerization forming inactive and insoluble derivatives<sup>(1369)</sup>, especially at high temperatures.<sup>(4)</sup> Solutions that are grossly opaque or contain a precipitate should not be used.<sup>(1-10/06)</sup> <sup>(4)</sup>

Thiotepa is stable in alkaline media but unstable in acidic media<sup>(1-10/06)</sup> <sup>(4)</sup>, undergoing increased rates of hydrolysis.<sup>(1389)</sup>

*Syringes* — Thiotepa reconstituted to a concentration of 10 mg/mL with sterile water for injection was found to be stable for 24 hours under refrigeration at 8 °C and at room temperature of 23 °C in both the original vials and transferred to plastic syringes.<sup>(2006)</sup>

*Filtration* — Thiotepa 10 to 300 mcg/mL exhibited no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters.<sup>(1415)</sup> <sup>(1416)</sup>

### Compatibility Information

#### Solution Compatibility

##### Thiotepa

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	BA <sup>a</sup> , MG <sup>b</sup>	IMM	0.5 g	Physically stable. Losses of 10% or less in 8 hr at 4 and 23 °C and 17% in 24 hr	2007	I
Dextrose 5%	BA <sup>a</sup> , MG <sup>b</sup>	IMM	5 g	Physically stable with losses of less than 10% in 14 days at 4 °C and in 3 days at 23 °C	2007	C

Sodium chloride 0.9%	BA <sup>a</sup>	IMM	1 and 3 g	Physically stable with 7 to 10% loss in 24 hr at 25 °C and 4% or less in 48 hr at 4 °C	<a href="#">2077</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	IMM	0.5 g	Physically stable but up to 7% loss in 8 hr with substantial chloro-adduct formation. Up to 13% loss in 24 hr at 25 °C	<a href="#">2077</a>	I
Sodium chloride 0.9%	BA <sup>a</sup>	IMM	0.5 g	Physically stable with 4% or less loss in 48 hr at 8 °C	<a href="#">2077</a>	C

<sup>a</sup>Tested in PVC containers.

<sup>b</sup>Tested in polyolefin containers.

## Ticarcillin Disodium-Clavulanate Potassium - AHFS

### 8:12.16.16

**Products** — Ticarcillin disodium-clavulanate potassium is available in vials containing 3.1 g (ticarcillin 3 g as the disodium salt plus clavulanic acid 100 mg as the potassium salt). Reconstitute the vials with 13 mL of sterile water for injection or sodium chloride 0.9% and shake well. When dissolution is completed, the solution will contain ticarcillin 200 mg/mL with clavulanic acid 6.7 mg/mL. <sup>(1-1/07)</sup>

The product is also available in a pharmacy bulk package containing 31 g (ticarcillin 30 g as the disodium salt plus clavulanic acid 1 g as the potassium salt). It should be reconstituted with 76 mL of sterile water for injection or sodium chloride 0.9%, added in two portions, and shaken well. Each milliliter of this concentrate contains ticarcillin 300 mg plus clavulanic acid 10 mg. <sup>(4)</sup>

Ticarcillin disodium-clavulanate potassium is available as a frozen premixed infusion containing 3.1 g in 100 mL of water (30 mg/mL of ticarcillin plus 1 mg/mL of clavulanic acid) with sodium citrate buffer and hydrochloric acid or sodium hydroxide to adjust pH. Thawing for use should be performed at room temperature or under refrigeration and not by warming in a water bath or by exposure to microwave radiation. Any precipitate that has formed during freezing should redissolve upon reaching room temperature. The container and ports should be checked for leaking by squeezing the bag. <sup>(4)</sup>

*pH* — From 5.5 to 7.5. <sup>(1-1/07)</sup>

*Osmolality* — The following maximum ticarcillin disodium-clavulanate potassium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients <sup>(1180)</sup> :

Diluent	Maximum Concentration <sup>a</sup> (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	48	562
Sodium chloride 0.9%	43	546
Sterile water for injection	86	573

<sup>a</sup>Ticarcillin concentration.

*Sodium and Potassium Content* — Each gram of this combination product contains 4.51 mEq of sodium and 0.15 mEq of potassium. <sup>(1-1/07)</sup>

The 3.1 g/100 mL frozen injection contains 0.187 mEq/mL of sodium and 0.005 mEq/mL of potassium. <sup>(4)</sup>

*Trade Name(s)* — Timentin

**Administration** — Reconstituted ticarcillin disodium-clavulanate potassium solutions should be further diluted to concentrations of 10 to 100 mg/mL of ticarcillin and given over 30 minutes by intermittent intravenous infusion directly into a vein or through a Y-type administration set. Other solutions should be temporarily discontinued during the infusion of ticarcillin disodium-clavulanate potassium. <sup>(1-1/07)</sup> <sup>(4)</sup>

**Stability** — The commercially available combination product as a powder is white to pale yellow. It should be stored at 24 °C or less. Higher temperatures may cause darkening, an indication of clavulanate potassium degradation. <sup>(4)</sup>

The concentrated reconstituted solutions, which are colorless to pale yellow, are stable for up to six hours after reconstitution when stored at room temperatures of 21 to 24 °C or for up to 72 hours when refrigerated at 4 °C. <sup>(1-1/07)</sup> (4)

The frozen premixed infusion solutions should be stored at -20 °C. After thawing at room temperature or under refrigeration, the solutions are stable for 24 hours at room temperature or seven days under refrigeration. Thawed solutions should not be refrozen. <sup>(4)</sup>

*pH Effects* — Clavulanic acid exhibits maximum stability at pH 6.4. <sup>(1797)</sup>

*Freezing Solutions* — Ticarcillin disodium-clavulanate potassium solutions of 10 to 100 mg/mL (ticarcillin content) in sodium chloride 0.9% or Ringer's injection, lactated, are stable for up to 30 days when frozen at -18 °C. Diluted to this concentration range in dextrose 5%, the drug is stable for up to seven days when frozen. Frozen solutions should be thawed at room temperature, and thawed solutions should be used within eight hours and not be refrozen. <sup>(1-1/07)</sup> (4)

*Elastomeric Reservoir Pumps* — Ticarcillin disodium-clavulanate potassium (Beecham) 15 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for two weeks at 35 °C with gentle agitation. <sup>(2014)</sup>

*Central Venous Catheter* — Ticarcillin disodium-clavulanate potassium (SmithKline Beecham) 10.33 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Ticarcillin disodium-clavulanate potassium

Solution	Mfr	Mfr Conc/L	Remarks	Ref	C/I
Dextrose 5%		10 to 100 g	Stable for 24 hr at room temperature and 3 days refrigerated	<a href="#">1(1/07)</a>	C
Ringer's injection, lactated		10 to 100 g	Stable for 24 hr at room temperature and 7 <sup>a</sup> or 4 <sup>b</sup> days refrigerated	<a href="#">1(1/07)</a>	C
Sodium chloride 0.9%		10 to 100 g	Stable for 24 hr at room temperature and 7 <sup>a</sup> or 4 <sup>b</sup> days refrigerated	<a href="#">1(1/07)</a>	C

<sup>a</sup>Prepared from the 200-mg/mL reconstituted solution.

<sup>b</sup>Prepared from the 300-mg/mL reconstituted bulk solution.

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Lyophilized formulation tested.

<sup>e</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>f</sup>Tested in sterile water for injection.

<sup>g</sup>Injected via Y-site into an administration set running azithromycin.

## Tigecycline - AHFS 8:12.24.12

**Products** — Tigecycline is available as a 50-mg lyophilized powder in vials with lactose monohydrate 100 mg as an excipient. The pH is adjusted with hydrochloric acid and, if necessary, sodium hydroxide. <sup>(1-2/09)</sup>

Reconstitute the vials with 5.3 mL of sodium chloride 0.9% or dextrose 5% and gently swirl to aid dissolution. The vials contain an excess of drug, and this reconstitution volume yields a 10-mg/mL solution. The reconstituted solution must be diluted for administration. <sup>(1-2/09)</sup>

**Trade Name(s)** — Tygacil

**Administration** — Tigecycline is administered by intravenous infusion over 30 to 60 minutes after dilution of the reconstituted solution in 100 mL of dextrose 5% or sodium chloride 0.9%. The concentration should not exceed 1 mg/mL. The solution should be yellow to orange. Discard if the solution does not have the correct color. <sup>(1-2/09)</sup>

**Stability** — Intact vials of tigecycline should be stored at controlled room temperature. Tigecycline reconstituted as directed may be stored at room temperature for up to six hours with an additional 18 hours after dilution in the infusion solution. Alternatively, the dilution for infusion may be stored for up to 48 hours under refrigeration if mixed immediately after reconstitution. The solution should be yellow to orange and should be inspected for the formation of a green or black discoloration. Discolored solutions should be discarded. <sup>(1-2/09)</sup>

Tigecycline - AHFS 8:12.24.12

## Tirofiban Hydrochloride - AHFS 20:12.18

**Products** — Tirofiban hydrochloride is available premixed as a ready-to-use solution for infusion in 100- and 250-mL (IntraVia) plastic containers. Each milliliter of the ready-to-use infusion provides tirofiban 0.05 mg (50 mcg) as the hydrochloride monohydrate along with sodium chloride 9 mg, sodium citrate dihydrate 0.54 mg, citric acid anhydrous 0.032 mg, and sodium hydroxide and/or hydrochloric acid to adjust pH in water for injection. <sup>(1-10/07)</sup>

*pH* — From 5.5 to 6.5. <sup>(1-10/07)</sup>

*Osmolality* — The osmolality of tirofiban hydrochloride premixed infusion solution is approximately 300 mOsm/kg. <sup>(4)</sup>

*Trade Name(s)* — Aggrastat

**Administration** — Tirofiban hydrochloride is administered only by intravenous infusion. The premixed infusion solution is ready to use and does not require dilution. <sup>(1-10/07)</sup>

**Stability** — Tirofiban hydrochloride ready-to-use infusion is clear and colorless. Intact plastic containers should be stored at controlled room temperature of 25 °C, with temperature excursions in the range of 15 to 30 °C permitted, and protected from light and freezing. <sup>(1-10/07)</sup>

Tirofiban Hydrochloride - AHFS 20:12.18

## Topotecan Hydrochloride - AHFS 10:00

**Products** — Topotecan hydrochloride is available in vials containing 4 mg of topotecan base (present as the hydrochloride) as a lyophilized powder. Reconstitute with 4 mL of sterile water for injection to yield a 1-mg/mL topotecan solution. In addition to topotecan hydrochloride, each milliliter of the reconstituted solution contains mannitol 12 mg and tartaric acid 5 mg. Hydrochloric acid and sodium hydroxide may have been used during manufacture to adjust the pH. The reconstituted solution must be diluted for use. <sup>(1-10/07)</sup>

*pH* — From 2.5 to 3.5. <sup>(1-10/07)</sup>

*Trade Name(s)* — Hycamtin

**Administration** — Topotecan hydrochloride is administered by intravenous infusion over 30 minutes after dilution in 50 to 250 mL of either sodium chloride 0.9% or dextrose 5%. Extravasation should be avoided; local reactions including erythema and bruising may result. <sup>(1-10/07)</sup> (4)

As for other toxic drugs, topotecan hydrochloride should be prepared and administered using protective measures to avoid inadvertent contact with the drug. The use of gloves, protective clothing, and vertical laminar flow hoods or biological safety cabinets is recommended. If skin contact with the drug does occur, wash the area thoroughly with soap and water. For mucous membrane contact, flush thoroughly with water. Disposal should also be performed safely to avoid inadvertent exposure. <sup>(1-10/07)</sup> (4)

**Stability** — Topotecan hydrochloride in intact vials should be stored in the original cartons at controlled room temperature and protected from light. The lyophilized drug is a light yellow to greenish powder. The reconstituted solution is yellow to yellow-green in color. <sup>(1-10/07)</sup> The reconstituted solution should be inspected for particulate matter in the vial and again in the transferring syringe prior to preparing admixtures. As for all parenteral products, the admixtures should also be inspected for particulate matter and discoloration prior to administration. (4)

Reconstituted topotecan hydrochloride is stated to be stable for 24 hours at 20 to 25 °C exposed to ambient light. (4) However, the manufacturer recommends use immediately after reconstitution because the product contains no antibacterial preservative. <sup>(1-10/07)</sup>

Other information indicates the reconstituted drug may be stable for longer periods. Vials of reconstituted topotecan hydrochloride at a concentration of 1 mg/mL were stored at 5, 25, and 30 °C both upright and inverted for 28 days. The solutions remained visually clear with no change in color, and little or no loss of topotecan hydrochloride occurred at any condition. <sup>(2211)</sup>

Topotecan hydrochloride 1 mg/mL reconstituted with sterile water for injection was physically and chemically stable for 28 days at 4 and 25 °C protected from light. No loss of topotecan was found, and no visible precipitation or color change occurred. <sup>(2243)</sup>

Whether any antimicrobial effect of topotecan hydrochloride exists is uncertain but could be concentration dependent. Two studies that have been performed seem to have different results, perhaps due to the very different topotecan hydrochloride concentrations being tested.

Topotecan hydrochloride 0.01 mg/mL diluted in sodium chloride 0.9% and stored at 22 °C did not exhibit an antimicrobial effect on the growth of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. The author recommended that diluted solutions of topotecan hydrochloride be stored under refrigeration whenever possible and that the potential for microbiological growth be considered when assigning expiration periods. <sup>(2160)</sup>

Topotecan hydrochloride 1 mg/mL reconstituted with sterile water did not support the growth of five organisms inoculated into the solution. The USP Preservative Effectiveness Test found that *Pseudomonas aeruginosa*, *Staphylococcus aureus*, and *Escherichia coli* were not viable after 16 hours, 24 hours, and 28 days, respectively. *Candida albicans* and *Aspergillus niger* did not lose viability but did not exhibit growth during the test. <sup>(2211)</sup>

*pH Effects* — Topotecan hydrochloride has a pH near 3 maintained with tartaric acid to ensure adequate solubility of greater than 2.5 mg/mL. The solubility decreases as the pH increases, becoming virtually insoluble at pH 4.5. <sup>(1747)</sup> Hydrolysis of the topotecan hydrochloride lactone ring is known to occur at pH values above 4. <sup>(2140)</sup>

## Compatibility Information

Topotecan Hydrochloride - AHFS 10:00

## Torsemide - AHFS 40:28

**Products** — Torsemide is available in 2- and 5-mL ampuls. Each milliliter of solution contains torsemide 10 mg along with polyethylene glycol 400, tromethamine, water for injection, and sodium hydroxide if needed to adjust pH during manufacture. <sup>(1-4/03)</sup>

*pH* — Approximately 8.3. <sup>(1-4/03)</sup>

**Administration** — Torsemide is administered intravenously either slowly as a bolus over two minutes or as a continuous infusion. If given through an intravenous line, flushing with sodium chloride 0.9% before and after torsemide administration is recommended. <sup>(1-4/03)</sup>

**Stability** — Intact containers of torsemide should be stored at controlled room temperature and protected from freezing. <sup>(1-4/03)</sup>

## Tramadol Hydrochloride - AHFS 28:08.08

**Products** — Tramadol hydrochloride is available as a 50-mg/mL aqueous solution in 1- and 2-mL (50- and 100-mg) ampuls. Sodium acetate and water for injection are also present in the formulation. <sup>(38)</sup> <sup>(115)</sup>

**Trade Name(s)** — Contramal, Topalgic, Tramal, Zamadol, Zydol

**Administration** — Tramadol hydrochloride is administered intramuscularly, by direct intravenous injection slowly over two to three minutes, or by intravenous infusion after dilution. <sup>(38)</sup> <sup>(115)</sup>

**Stability** — Tramadol hydrochloride is a clear, colorless solution. The intact ampuls should be stored below 30 °C. <sup>(38)</sup> <sup>(115)</sup>

Exposure to or protection from light did not affect the stability of tramadol hydrochloride 0.5- and 4-mg/mL infusion solutions in dextrose 5% or sodium chloride 0.9%. <sup>(434)</sup>

**Freezing Solutions** — Tramadol hydrochloride (Searle) 1 mg/mL in dextrose 5% in PVC bags was stored frozen at -20 °C for 120 days, microwave thawed, and stored refrigerated at 4 °C for 60 days. No visual changes and 5% loss of tramadol hydrochloride was found. <sup>(2450)</sup> <sup>(2526)</sup>

Tramadol Hydrochloride - AHFS 28:08.08

## Treprostinil Sodium - AHFS 24:12.92

**Products** — Treprostinil is available as 1-, 2.5-, 5-, and 10-mg/mL (as sodium) in 20-mL multiple-dose vials. Each milliliter also contains sodium chloride 5.3 mg (except the 10-mg/mL concentration which contains 4 mg), metacresol 3 mg, and sodium citrate 6.3 mg in water for injection. Sodium hydroxide and/or hydrochloric acid may have been added during manufacturing to adjust the pH. [\(1-9/08\)](#)

*pH* — From 6.0 to 7.2. [\(1-9/08\)](#)

*Trade Name(s)* — Remodulin

**Administration** — Treprostinil sodium is preferably administered by continuous subcutaneous infusion using a syringe pump designed for subcutaneous administration. The drug may also be administered via a central venous catheter only after dilution in sterile water for injection, sodium chloride 0.9%, or Flolan special diluent using an intravenous infusion pump. The subcutaneous or intravenous infusion pump must have a reservoir made of polypropylene, polyvinyl chloride, or glass. [\(1-9/08\)](#)

**Stability** — Intact vials should be stored at controlled room temperature. The drug is stable at room temperature and neutral pH. The manufacturer recommends using the vials for no more than 14 days after initial stopper penetration. The undiluted drug is stable for up to 72 hours at 37 °C during administration in syringe reservoirs. The manufacturer states that after dilution in sterile water for injection, sodium chloride 0.9%, or Flolan special diluent, the drug is stable for 48 hours at 37 °C at concentrations as low as 4 mcg/mL. [\(1-9/08\)](#)

Using proper technique to penetrate the vial stopper with a needle, limiting the number of punctures of a vial stopper to 10, and using a Clave Connector Multidose Vial Adapter were shown to reduce the amount of particulate matter from the stopper that was found upon multiple-day use of treprostinil sodium 1- and 10-mg/mL vials and to be within the USP limit for such particulate matter over the 30-day test period. No loss of treprostinil sodium occurred during this period as well. Improper needle technique and numerous stopper penetrations were found to result in unacceptable particulate matter from the vial stopper. [\(2611\)](#)

*Syringes* — The chemical and physical stability of undiluted treprostinil sodium (United Therapeutics) 1, 2.5, 5, and 10 mg/mL was evaluated packaged in 3-mL MiniMed plastic syringe pump reservoirs sealed with plastic tip caps. The samples were stored at 37, 23, 4, and -20 °C for 60 days. The samples were clear and colorless, and treprostinil was stable at all four storage temperatures, exhibiting concentrations of 95% or more over 60 days. [\(2528\)](#)

### Compatibility Information

#### Solution Compatibility

##### Treprostinil sodium

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	BA <sup>a</sup>	UT	4 mcg/mL	Treprostinil loss of 15 to 20% in 24 to 48 hr at 40 °C. Up to 70% loss of metacresol preservative	<a href="#">2476</a>	I
Dextrose 5%	BA <sup>a</sup>	UT	20 and 130 mcg/mL	Treprostinil loss of 5% or less in 48 hr at 40 °C. Up to 70% loss of metacresol preservative	<a href="#">2476</a>	C
Sodium chloride 0.9%	BA <sup>a</sup>	UT	4 and 130 mcg/mL	Little or no treprostinil loss in 48 hr at 40 °C. Up to 70% loss of metacresol preservative	<a href="#">2476</a>	C

<sup>a</sup>Tested in medication cassette reservoirs (SIMS-Deltec).

## Trimethobenzamide Hydrochloride - AHFS 56:22.08

**Products** — Trimethobenzamide hydrochloride 100 mg/mL is available in 2-mL single-dose and 20-mL multiple-dose vials. Each milliliter of solution also contains sodium citrate, citric acid, and sodium hydroxide to adjust pH. Some products may contain edetate disodium. The multiple-dose vials also contain phenol 0.45%. [\(1-6/09\)](#)

*pH* — The official pH range is 4.5 to 5.5. [\(17\)](#) The manufacturer indicates the actual pH is approximately 5. [\(1-6/09\)](#)

*Trade Name(s)* — Tigan

**Administration** — Trimethobenzamide hydrochloride is administered by intramuscular injection deep into the upper outer quadrant of the gluteal region. Intravenous injection is not recommended. [\(1-6/09\)](#) [\(4\)](#)

**Stability** — Trimethobenzamide hydrochloride should be stored at controlled room temperature and protected from freezing. [\(1-6/09\)](#) [\(4\)](#)

## Trimethoprim-Sulfamethoxazole (CO-TRIMOXAZOLE) - AHFS 8:12.20

**Products** — Trimethoprim-sulfamethoxazole 16 + 80 mg/mL is available as a concentrate in 5-, 10-, and 30-mL vials. Each milliliter also contains propylene glycol, ethyl alcohol, diethanolamine, benzyl alcohol, sodium metabisulfite, and sodium hydroxide to adjust pH in water for injection. (1-9/08)

*pH* — From 9.5 to 10.5 (1-9/08)

*Osmolality* — The osmolalities of trimethoprim-sulfamethoxazole (Burroughs Wellcome) in concentrations of 0.8 + 4, 1.1 + 5.5, and 1.6 + 8 mg/mL in dextrose 5% were determined to be 541, 669, and 798 mOsm/kg, respectively. At 1.6 + 8 mg/mL in sodium chloride 0.9%, the osmolality was determined to be 833 mOsm/kg. (1375)

*Trade Name(s)* — Bactrim®

**Administration** — Trimethoprim-sulfamethoxazole is administered by intravenous infusion only after dilution in dextrose 5%. The drug should not be injected intramuscularly. Infusion over 60 to 90 minutes is recommended; rapid or direct intravenous injection must not be used. It is recommended that each 5 mL be diluted in 125 mL or, if fluid restriction is required, in 75 mL of dextrose 5%. Infusion admixtures should be inspected for cloudiness or crystallization before and during administration. (1-9/08) (4)

**Stability** — Trimethoprim-sulfamethoxazole in intact vials should be stored at controlled room temperature and not refrigerated. The multiple-dose vials should be used within 48 hours of initial entry. (1-9/08)

The solubility of trimethoprim in aqueous solutions is partially dependent on the pH of the solution. Trimethoprim is a weak base, and its solubility is lower in solutions with a more alkaline pH. (553)

Precipitation occurs in the diluted infusion solution in varying time periods, depending on the final concentration. For dilutions of 5 mL per 125 mL of dextrose 5% (trimethoprim 640 mg/L, sulfamethoxazole 3.2 g/L), use within six hours is recommended. (1-9/08) However, precipitation within four hours has been observed at this concentration. (553) For dilutions of 5 mL per 100 mL of dextrose 5% (trimethoprim 800 mg/L, sulfamethoxazole 4 g/L), use within four hours is recommended. For dilutions of 5 mL per 75 mL of dextrose 5% (trimethoprim 1.067 g/L, sulfamethoxazole 5.33 g/L), use within two hours is recommended. All infusions should be inspected carefully and watched closely for turbidity and precipitation. Infusion admixtures in dextrose 5% should not be refrigerated. (1-9/08) (4)

The nature of the precipitate that forms from seven infusion solutions containing trimethoprim-sulfamethoxazole (Roche) was evaluated. In all cases, the sulfamethoxazole concentrations were within 5% of expected values, but the trimethoprim concentrations dropped to about 30% of the initial values. Further evaluation of the solid phases showed them to be trimethoprim alone or with trimethoprim monohydrate. (1895)

*Syringes* — Undiluted trimethoprim-sulfamethoxazole (Elkins-Sinn) (16 + 80 mg/mL) was stored in polypropylene syringes (Becton Dickinson) for 2.5 days at room temperature. The syringes were exposed to fluorescent light during the day but kept in the dark at night. No loss was observed. (1582)

*Sorption* — Trimethoprim was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes. (536) (606)

*Plasticizer Leaching* — Trimethoprim-sulfamethoxazole (Elkins-Sinn) 0.8 + 4 mg/mL in dextrose 5%

did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24 °C. <sup>(1683)</sup>

**Filtration** — Filtration of dilutions of trimethoprim-sulfamethoxazole (Roche), ranging from 1:25 (v/v) to 1:10 (v/v) in several common intravenous infusion solutions, did not appear to result in loss of either drug because of sorption to the filter. Filtration of a visibly precipitated solution resulted in a substantial loss of trimethoprim. <sup>(747)</sup>

Trimethoprim-sulfamethoxazole (Roche) 1.88 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22-µm cellulose ester membrane filter (Ivex-HP, Millipore) over six hours. No significant drug loss due to binding to the filter was noted. <sup>(1034)</sup>

Trimethoprim-Sulfamethoxazole (CO-TRIMOXAZOLE) - AHFS 8:12.20

## Tropisetron Hydrochloride - AHFS 56:22.20

**Products** — Tropisetron hydrochloride is available as an aqueous solution in 2- and 5-mL ampuls. Each milliliter of solution provides 1 mg of tropisetron (present as 1.13 mg of the hydrochloride). Also present in the formulation are acetic acid, sodium acetate, sodium chloride, and water for injection. <sup>(38)</sup> <sup>(115)</sup>

**Trade Name(s)** — Navoban

**Administration** — Tropisetron hydrochloride is administered either as a slow intravenous injection over not less than 30 seconds for a 2-mg dose <sup>(38)</sup> <sup>(115)</sup> or one minute for a 5-mg dose <sup>(115)</sup> or as an intravenous infusion over 15 minutes. <sup>(38)</sup>

**Stability** — Tropisetron hydrochloride injection is a colorless or faintly brown-yellow solution. Intact ampuls should be stored at room temperature. <sup>(38)</sup>

**Syringes** — Tropisetron hydrochloride (Sandoz) 1 mg/mL was packaged in polypropylene syringes (Becton Dickinson) and stored under refrigeration at 4 °C and at room temperature about 23 °C exposed to daylight and protected from light for 15 days. About 4% loss of tropisetron hydrochloride occurred in 15 days under any of the storage conditions. <sup>(2298)</sup>

**Sorption** — The manufacturer indicates that tropisetron hydrochloride solutions are compatible with both glass and PVC containers and infusion sets. <sup>(38)</sup>

Tropisetron Hydrochloride - AHFS 56:22.20

## Valproate Sodium - AHFS 28:12.92

**Products** — Valproate sodium is available in 5-mL single-dose vials. Each milliliter of solution contains valproate sodium equivalent to valproic acid 100 mg and edetate disodium 0.4 mg in water for injection. Sodium hydroxide and/or hydrochloric acid may have been used to adjust pH during manufacture. The product should be diluted for use. <sup>(1-3/07)</sup>

pH — 7.6. <sup>(1-3/07)</sup> (4)

**Trade Name(s)** — Depacon

**Administration** — Valproate sodium is usually administered as an intravenous infusion over 60 minutes at a rate that does not exceed 20 mg/min diluted in at least 50 mL of a compatible infusion solution. More rapid infusion at a rate of 1.5 to 3 mg/kg/min over 5 to 10 minutes has been used in one study. <sup>(1-3/07)</sup>

**Stability** — Intact vials should be stored at controlled room temperature. The injection is a clear, colorless solution. Because no antibacterial preservatives are present in the formulation, any unused solution remaining in a vial after entry should be discarded. <sup>(1-3/07)</sup>

## Vancomycin Hydrochloride - AHFS 8:12.28.16

**Products** — Vancomycin hydrochloride is available in vials containing drug equivalent to 500 mg or 1 g of vancomycin base. Reconstitute the vials with 10 or 20 mL, respectively, of sterile water for injection to yield a solution containing 50 mg of base (as the hydrochloride) per milliliter.

Vancomycin hydrochloride is also available in 5- and 10-g pharmacy bulk packages. <sup>(1-10/08)</sup> (4)

*pH* — A 5% solution in water has a pH of 2.5 to 4.5. <sup>(1-10/08)</sup>

*Osmolality* — Vancomycin hydrochloride (Lilly) 50 mg/mL in sterile water for injection has an osmolality of 57 mOsm/kg. <sup>(50)</sup>

The osmolality of vancomycin hydrochloride (Lederle) 5 mg/mL was determined to be 249 mOsm/kg in dextrose 5% and 291 mOsm/kg in sodium chloride 0.9%. <sup>(1375)</sup>

**Administration** — Vancomycin hydrochloride is administered by intermittent <sup>(1-10/08)</sup> (4) or continuous <sup>(4)</sup> intravenous infusion. The drug is extremely irritating to tissue and may cause necrosis. Therefore, it should not be given by intramuscular injection, and extravasation should be avoided during intravenous administration. For intermittent intravenous infusion, 500 mg to 1 g should be added to 100 to 200 mL, respectively, of dextrose 5% or sodium chloride 0.9% and administered over at least one hour. <sup>(1-10/08)</sup> (4) For continuous infusion, 1 to 2 g may be added to a fluid volume sufficient to permit administration of the daily dose over 24 hours. <sup>(4)</sup> Thrombophlebitis can be minimized by using dilute solutions of 2.5 to 5 mg/mL and rotating injection sites. <sup>(1-10/08)</sup> (4)

**Stability** — Intact vials should be stored at controlled room temperature. The manufacturer indicates that reconstituted solutions of vancomycin hydrochloride are stable for 14 days under refrigeration <sup>(1-10/08)</sup>; other information indicates that the drug is also stable in solution for 14 days at room temperature. <sup>(4)</sup> (141)

*pH Effects* — In the pH range of 2 to 10, vancomycin hydrochloride degradation is principally deamidation. <sup>(1927)</sup> Vancomycin hydrochloride has been reported to be most stable at pH 3 to 5 <sup>(141)</sup> and at pH 5.5 <sup>(1927)</sup>, with relatively pH-independent decomposition in the range of 3 to 8. <sup>(1927)</sup> The stability of a 1-mg/mL concentration was evaluated in buffer solutions having pH values of 1.4, 5.6, and 7.1 at 24 °C. Little or no loss occurred in 24 hours in any solution. However, the pH 1.4 buffer had a 19% loss in five days, the pH 5.6 buffer had a 10% loss in 17 days, and the pH 7.1 buffer had an 11% loss in five days. <sup>(1134)</sup>

In an accelerated study at 66 °C, the half-life of vancomycin B (the largest component of the commercial product) was 400 minutes in a phosphate buffer with a pH of 2.2 and 650 minutes in a phosphate buffer with a pH of 7. <sup>(1354)</sup>

Vancomycin hydrochloride has a low pH and may cause a physical incompatibility with other drugs, especially drugs with an alkaline pH. <sup>(1-10/08)</sup> (4) (873)

The concentration dependency of compatibility or incompatibility of vancomycin hydrochloride mixed with or administered simultaneously with a number of penicillins and cephalosporins has been demonstrated. <sup>(2189)</sup> Vancomycin hydrochloride has a low pH and is variably compatible with drugs having neutral to mildly alkaline pH, including cephalosporins and penicillins. The compatibility may depend on a number of factors including concentration of each drug, dilution vehicle, actual pH of solutions, and completeness of mixing during administration. Combinations that are compatible when well mixed may result in precipitation if only partially mixed, presumably due to regionally different concentrations and pH values. If attempting to administer vancomycin hydrochloride with another drug product, care should be taken to ensure that the specific combination and concentrations are compatible under the exact administration conditions to be used. An inline filter should be used as a

final safety measure. [\(2189\)](#)

*Freezing Solutions* — Vancomycin hydrochloride (Lilly) at a concentration of 5 mg/mL in dextrose 5% or sodium chloride 0.9% exhibited no loss after 63 days of storage when frozen at -10 °C. However, neither did a loss occur in the same time period when the solution was stored at 5 °C. [\(1134\)](#)

In one study, vancomycin hydrochloride (Lilly) 5 mg/mL in dextrose 5% was stored frozen at -20 °C for 105 days. After thawing in a microwave, the samples were stored for 56 more days under refrigeration. The samples remained clear and had no color change. In addition, no loss of vancomycin occurred throughout the entire test period. [\(2682\)](#)

*Syringes* — The stability of vancomycin hydrochloride (Lilly) 5 mg/mL in dextrose concentrations ranging from 5 to 30% and packaged in plastic syringes was studied. The syringes were stored at 4 °C for 24 hours followed by two hours at room temperature. Little change in the concentration occurred. [\(1301\)](#)

The stability of vancomycin hydrochloride (Lilly) reconstituted to a concentration of 10 mg/mL with sterile water for injection, dextrose 5%, and 0.9% sodium chloride repackaged into plastic syringes was studied. Five milliliters of the solutions were filled into three-piece Plastipak (Becton Dickinson) and two-piece Injekt (Braun) syringes that were then sealed with Luer-Lok hubs (Vigon) and stored at 4 and 25 °C for 84 days. Under refrigeration, vancomycin hydrochloride prepared with all three solutions and packaged in both kinds of syringes was physically and chemically stable for the 84-day period; losses were 4% or less. [\(1893\)](#)

However, stored at 25 °C in the Plastipak syringes, 10% loss occurred in about 47 days in water, 55 days in dextrose 5%, and 62 days in sodium chloride 0.9%. In the Injekt syringes, stability was less; 10% loss occurred in 29 days in water, 33 days in dextrose 5%, and 34 days in sodium chloride 0.9%. In addition, a degradation product appeared as a white flocculent precipitate in all room temperature samples after about eight weeks of storage. [\(1893\)](#)

Vancomycin hydrochloride 5 mg/mL in dextrose 5% and in sodium chloride 0.9% packaged in polypropylene syringes (Becton Dickinson) exhibited less than 10% loss in 14 days at room temperature and in 6 months under refrigeration. Refrigerated solutions warmed to room temperature were stable for 48 hours. [\(2730\)](#)

*Elastomeric Reservoir Pumps* — Vancomycin hydrochloride (Lilly) 10 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for two weeks at 35 °C with gentle agitation. [\(2014\)](#)

*Implantable Pumps* — Vancomycin hydrochloride (Lilly) 1 mg/mL in water in an implantable pump (Infusaid model 100) was incubated in a water bath at 37 °C for 28 days. Vancomycin losses were substantial—about 25% in seven days and 40% in 28 days. At the end of the test period, a colloidal precipitate also was found in the pumps. [\(1302\)](#)

*Sorption* — Vancomycin hydrochloride (Lilly) 15 mg/mL in dextrose 5% is reported to undergo substantial sorption to Teflon tubing used in an automatic dilutor (Syva). The vancomycin hydrochloride was apparently released from the tubing into subsequent solutions resulting in vancomycin toxicity. [\(2153\)](#)

Vancomycin hydrochloride 10 mg/mL with heparin sodium 5000 units/mL as an antibiotic lock in polyurethane central hemodialysis catheters lost about 50% of the antibiotic over 72 hours at 37 °C. The loss was attributed to sorption to the catheters, although precipitation is also possible. Nevertheless, the reduced antibiotic concentration (about 5 mg/mL) remained effective against common microorganisms in catheter-related bacteremia in hemodialysis patients. [\(2515\)](#) [\(2516\)](#)

*Plasticizer Leaching* — Vancomycin hydrochloride (Qualimed Laboratories) 8 mg/mL in dextrose 5%

and sodium chloride 0.9% in PVC containers (Macropharma) did not leach detectable amounts of DEHP plasticizer during simulated administration over 24 hours. If any DEHP was present, the concentration was less than 1 mcg/mL, the limit of detection in this study. <sup>(2148)</sup>

*Filtration* — Vancomycin hydrochloride (Lilly) 2 mg/mL in dextrose 5% or sodium chloride 0.9% was filtered through a 0.22-µm cellulose ester filter (Ivex-HP, Millipore) over six hours. No significant drug loss due to binding to the filter was noted. <sup>(1034)</sup>

*Central Venous Catheter* — Vancomycin hydrochloride (Fujisawa) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup>Tested in sterile water for injection.

<sup>e</sup>Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix I).

<sup>f</sup>Concentration unspecified.

<sup>g</sup>Infused over one hour simultaneously with methotrexate.

<sup>h</sup>Tested with 0.1% albumin human added.

<sup>i</sup>Lyophilized formulation tested.

<sup>j</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>k</sup>Run at 21 mL/hr.

<sup>l</sup>Given over 30 minutes by syringe pump.

<sup>m</sup>Run at 94 mL/hr.

<sup>n</sup>Run at 10 mL/hr.

<sup>o</sup>Given over one hour by syringe pump.

<sup>p</sup>Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>q</sup>Tested with albumin human 0.1%.

<sup>r</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>s</sup>Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>t</sup>Ampicillin sodium component. Ampicillin sodium in a 2:1 fixed-ratio concentration with sulbactam sodium.

<sup>u</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

---

### **Additional Compatibility Information**

*Peritoneal Dialysis Solutions* — The activity of vancomycin 15 mg/L was evaluated in peritoneal dialysis fluids containing dextrose 1.5 or 4.25% (Dianeal 137, Travenol). Storage at 25 °C resulted in virtually no loss of antimicrobial activity in 24 hours. <sup>(515)</sup>

Vancomycin hydrochloride with aztreonam admixed in Dianeal 137 with dextrose 4.25% is stated to be stable for 24 hours at room temperature. <sup>(1-10/08)</sup>

Vancomycin hydrochloride (Lilly) 10 and 50 mg/L in peritoneal dialysis concentrate with dextrose 50% (McGaw) retained 93 to 100% of its initial activity after 24 hours of storage at room temperature. <sup>(1044)</sup>

The stability of vancomycin hydrochloride (Lilly) 20 mg/L in peritoneal dialysis solutions (Dianeal 137 and PD2) with heparin sodium 500 units/L was evaluated. Approximately 95 ± 12% activity remained after 24 hours at 25 °C. <sup>(1228)</sup>

Vancomycin hydrochloride (Lilly) 15 mg/L to 5.3 g/L in Dianeal with dextrose 2.5 or 4.25% was physically compatible with heparin sodium (Organon) 500 to 14,300 units/L for 24 hours at 25 °C under fluorescent light. However, a white precipitate formed immediately in combinations of heparin sodium with vancomycin hydrochloride 6.9 to 14.3 g/L. <sup>(1322)</sup>

The retention of antimicrobial activity of vancomycin hydrochloride (Lilly) 1 g/L alone and with each of the aminoglycosides gentamicin sulfate (SoloPak) 120 mg/L and tobramycin sulfate (Lilly) 120 mg/L in Dianeal PD-2 (Travenol) with dextrose 1.5% was evaluated. Little or no loss of any antibiotic occurred in eight hours at 37 °C. Vancomycin hydrochloride alone retained activity for at least 48 hours at 4 and 25 °C. In combination with gentamicin sulfate and tobramycin sulfate, antimicrobial activity of both vancomycin and the aminoglycosides was retained for up to 48 hours. However, refrigeration at 4 °C was recommended for storage periods greater than 24 hours. <sup>(1414)</sup>

The stability of vancomycin hydrochloride (Lilly) 25 mg/L in Dianeal 137 (Baxter) with dextrose 1.36 and 3.86%, while protected from direct sunlight, was evaluated. At both dextrose concentrations, less than 4% vancomycin hydrochloride was lost in 42 days at 4 °C. At 20 °C, a 5% or less loss occurred in 28 days. At 37 °C, a 10% loss occurred in six to seven days. <sup>(1654)</sup>

Vancomycin hydrochloride (Lilly) 1 mg/mL admixed with ceftazidime (Lilly) 0.5 mg/mL in Dianeal PD-2 (Baxter) with 1.5% and also 4.25% dextrose were evaluated for compatibility and stability. Samples were stored under fluorescent light at 4 and 24 °C for 24 hours and at 37 °C for 12 hours. No precipitation or other change was observed by visual inspection in any sample. No loss of either drug was found in the samples stored at 4 °C and no loss of vancomycin hydrochloride and about 4 to 5% ceftazidime loss in the samples stored at 24 °C in 24 hours. Vancomycin hydrochloride losses of 3% or less and ceftazidime loss of about 6% were found in the samples stored at 37 °C for 12 hours. No difference in stability was found between samples at either dextrose concentration. <sup>(2217)</sup>

Vancomycin hydrochloride (Lederle) 0.05 mg/mL in Dianeal PD-2 with dextrose 1.5% with or without

heparin sodium 1 unit/mL in PVC bags was chemically stable for up to six days at 4 °C (about 3 to 5% loss) and 25 °C (up to 7% loss) and five days at body temperature of 37 °C. <sup>(866)</sup>

The addition of ceftazidime (Glaxo) 0.1 mg/mL to this peritoneal dialysis solution demonstrated a somewhat reduced stability with the ceftazidime being the defining component. The ceftazidime was chemically stable for up to six days at 4 °C (about 3% loss), three days at 25 °C (about 9 to 10% loss), and 12 hours at body temperature of 37 °C with the vancomycin exhibiting less loss throughout. <sup>(866)</sup>

Vancomycin hydrochloride (Lederle) 25 mcg/mL in Delflex peritoneal dialysis solution bags with 2.5% dextrose (Fresenius) was stable with little loss occurring in 14 days refrigerated and at room temperature. <sup>(2573)</sup>

Gentamicin sulfate (American Pharmaceutical Partners) 8 mcg/mL with vancomycin hydrochloride (Lederle) 25 mcg/mL in Delflex peritoneal dialysis solution bags with 2.5% dextrose (Fresenius) was stable with little or no loss of either drug occurring in 14 days refrigerated and at room temperature. <sup>(2573)</sup>

Vancomycin hydrochloride (Abbott) 1 mg/mL in icodextrin 7.5% PD (Baxter) was tested for stability at 5, 24, and 37 °C. The solutions remained clear and colorless. Little or no loss at 5 °C and about 3% loss at 24 °C after seven days of storage was found. At 37 °C, about 6% loss occurred in 24 hours. <sup>(2650)</sup>

*Heparin Locks* — Vancomycin hydrochloride (Lilly) 25 mcg/mL and heparin sodium (Elkins-Sinn) 100 units/mL in 0.9% sodium chloride injection as a catheter flush solution was evaluated for stability when stored at 4 °C for 14 days. The flush solution was visually clear, and the vancomycin activity and heparin activity were retained throughout the storage period. However, an additional 24 hours at 37 °C to simulate use conditions resulted in losses of both agents ranging from 20 to 37%. <sup>(1933)</sup>

Vancomycin hydrochloride (Lilly) 25 mcg/mL and preservative-free heparin sodium (Elkins-Sinn) 100 units/mL in 0.9% sodium chloride in 2-mL glass vials for use as a central catheter flush solution were evaluated for compatibility and stability at 4 and 28 °C. Visual inspection found no evidence of color change or particulate formation throughout the study. Heparin activity remained unchanged for 100 days. Acceptable vancomycin levels were maintained for 30 days at 28 °C and for 63 days at 4 °C. However, unacceptable losses occurred after those times. The activity of both drugs was unaffected by the presence of the other when compared to the activity of single drug controls. <sup>(2279)</sup>

Vancomycin hydrochloride 25 mcg/mL combined with heparin sodium (Hospira) 10 units/mL in sterile water for injection for use as a lock solution was found to be physically compatible. Little or no vancomycin loss occurred in 3 days at 4 °C. However, losses of 8% occurred in 3 days at 27 °C and 1 day at 40 °C. <sup>(2820)</sup>

If ciprofloxacin (Sicor) 2 mg/mL was added to this flush solution, a white precipitate appeared within 1 day. Losses of both ciprofloxacin and vancomycin occurred as well. <sup>(2820)</sup>

Vancomycin Hydrochloride - AHFS 8:12.28.16

## Vasopressin - AHFS 68:28

**Products** — Vasopressin is available in 0.5-, 1-, and 10-mL vials. Each milliliter of solution contains vasopressin 20 pressor units, sodium chloride 0.9%, chlorobutanol 0.5%, in water for injection. Acetic acid and/or sodium hydroxide may have been used to adjust pH during manufacture. <sup>(1-11/05)</sup>

*pH* — From 2.5 to 4.5. <sup>(1-11/05)</sup> (4)

**Administration** — Vasopressin may be given subcutaneously or intramuscularly. <sup>(1-11/05)</sup> (4) or by continuous intravenous or intra-arterial infusion using a controlled infusion device. For infusion, the drug is usually diluted to a concentration of 0.1 to 1 unit/mL with sodium chloride 0.9% or dextrose 5%. <sup>(4)</sup>

**Stability** — Vasopressin injection is a clear, colorless or practically colorless solution. Intact containers should be stored at controlled room temperature and protected from freezing. <sup>(1-11/05)</sup> (4)

Vasopressin - AHFS 68:28

## Vecuronium Bromide - AHFS 12:20.20

**Products** — Vecuronium bromide is available in 10-mg vials as a lyophilized cake, both with and without accompanying bacteriostatic water for injection with benzyl alcohol 0.9% for use as a diluent. It also is available in 20-mg vials without a diluent. The vials also contain citric acid anhydrous, mannitol, and sodium phosphate dibasic anhydrous. Sodium hydroxide and/or phosphoric acid also may be present to adjust the pH. <sup>(1-7/07)</sup>

The 10- and 20-mg vials should be reconstituted with 10 and 20 mL, respectively, of the accompanying bacteriostatic water for injection or sterile water for injection to yield a 1-mg/mL solution. <sup>(1-7/07)</sup> <sup>(4)</sup> The bacteriostatic water for injection, which contains benzyl alcohol 0.9%, is not for use in newborns. <sup>(1-7/07)</sup>

*pH* — From 3.5 to 4.5 <sup>(1-7/07)</sup>

*Osmolality* — The osmolality of vecuronium bromide 4 mg/mL was determined to be 292 mOsm/kg. <sup>(1233)</sup>

**Administration** — Vecuronium bromide may be administered by rapid intravenous injection or by intravenous infusion using an infusion control device at a concentration of 0.1 to 0.2 mg/mL in a compatible solution. It should not be administered intramuscularly. <sup>(4)</sup>

**Stability** — Vecuronium bromide should be stored at room temperature and protected from light. The reconstituted solution is clear and colorless. When reconstituted with bacteriostatic water for injection, the solution may be used for up to five days when stored at room temperature or under refrigeration. When reconstituted with sterile water for injection, the vial is a single-use container and should be stored under refrigeration and used within 24 hours. <sup>(1-7/07)</sup>

*pH Effects* — Vecuronium bromide is unstable in the presence of bases and should not be combined with alkaline drugs or simultaneously administered through the same line as an alkaline solution. <sup>(4)</sup>

*Syringes* — Vecuronium bromide 1 mg/mL in sterile water for injection and packaged in plastic syringes was found to be stable with no loss of drug for 21 days at room temperature and refrigerated. <sup>(2735)</sup>

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>d</sup>Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix I).

<sup>e</sup>Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>f</sup>Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>g</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

Vecuronium Bromide - AHFS 12:20.20

## Verapamil Hydrochloride - AHFS 24:28.92

**Products** — Verapamil hydrochloride is available in single-dose containers including 2-mL ampuls, vials, and syringes and in 4-mL vials and syringes. Each milliliter contains verapamil hydrochloride 2.5 mg with sodium chloride 8.5 mg in water for injection. Hydrochloric acid may have been used to adjust pH during manufacture. <sup>(1-7/06)</sup>

*pH* — From 4 to 6.5. <sup>(1-7/06)</sup>

*Osmolality* — The osmolality of verapamil hydrochloride 2.5 mg/mL was determined to be 290 mOsm/kg. <sup>(1233)</sup>

**Administration** — Verapamil hydrochloride is administered slowly intravenously. Direct intravenous injection should be performed over at least two minutes and at least three minutes in older patients. <sup>(1-7/06)</sup> <sup>(4)</sup> Intravenous infusion has also been performed. <sup>(4)</sup>

**Stability** — Verapamil hydrochloride should be stored at controlled room temperature and protected from light. <sup>(1-7/06)</sup> Freezing should be avoided. <sup>(4)</sup> It is physically compatible in solution over a pH range of 3 to 6 but may precipitate in solutions having a pH greater than 6 <sup>(1-7/06)</sup> <sup>(4)</sup> or 7. <sup>(1384)</sup>

Verapamil hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38 °C over four weeks. Analysis found no loss of the drug under these conditions. <sup>(2562)</sup>

Verapamil Hydrochloride - AHFS 24:28.92

## Vinblastine Sulfate - AHFS 10:00

**Products** — Vinblastine sulfate is available in 10-mL vials containing 10 mg of lyophilized drug without excipients. It should be reconstituted with 10 mL of sodium chloride 0.9% or bacteriostatic sodium chloride 0.9% (preserved with benzyl alcohol) to yield a 1-mg/mL solution. <sup>(1-6/06)</sup>

Vinblastine sulfate is also available as a 1-mg/mL solution with benzyl alcohol 0.9% in 10-mL vials. <sup>(1-6/06)</sup> <sup>(4)</sup>

*pH* — The pH of the reconstituted lyophilized product is 3.5 to 5. <sup>(1-6/06)</sup> The pH of the vinblastine sulfate injection is 3 to 5.5. <sup>(4)</sup>

**Administration** — Vinblastine sulfate is administered intravenously only. It should not be given by any other route. A sticker is provided in the vinblastine sulfate package that must be affixed directly to the container of the individual dose that states <sup>(1-6/06)</sup> :

***Fatal if given intrathecally. For intravenous use only.***

In addition, the container holding an individual dose must be enclosed in an overwrap which is labeled <sup>(1-6/06)</sup> :

***Do not remove covering until moment of injection.***

***Fatal if given intrathecally. For intravenous use only.***

The drug may be administered over one minute directly into a vein or into the tubing of a running infusion solution. Generally, dilution of vinblastine sulfate in larger amounts of intravenous fluid and administration over longer time periods are not recommended. Extravasation should be avoided. <sup>(1-6/06)</sup> <sup>(4)</sup>

In the event of spills or leaks, sodium hypochlorite 5% (household bleach) has been used to inactivate vinblastine sulfate. <sup>(1200)</sup>

**Stability** — The vials should be refrigerated to ensure extended stability. <sup>(1-6/06)</sup> Room temperature stability of intact vials has been variously reported for the Lilly product to be at least one month <sup>(853)</sup> and only 14 days. <sup>(1433)</sup> The Lyphomed product has been reported to be stable for up to three months <sup>(1181)</sup> and for less than two months. <sup>(1433)</sup> The solution reconstituted with bacteriostatic sodium chloride injection is stable under refrigeration for 28 days. If reconstituted with unpreserved sodium chloride injection, any remaining unused drug should be discarded immediately. <sup>(1-6/06)</sup>

Vinblastine sulfate 0.015 and 0.5 mg/mL in sodium chloride 0.9% did not inhibit the growth of deliberately inoculated *Staphylococcus epidermidis* ( $10^6$  to  $10^7$  CFU/mL) during 21 days at 35 °C (representing near body temperature). <sup>(1659)</sup>

Immersion of a needle with an aluminum component in vinblastine sulfate 1 mg/mL resulted in no visually apparent reaction after seven days at 24 °C. <sup>(988)</sup>

*pH Effects* — Maximum stability for vinblastine sulfate in aqueous solutions was determined to be pH 2 to 4. Vinblastine sulfate in solution at pH 3 retained 90% after 39 days at 20 °C. <sup>(1307)</sup>

Vinblastine sulfate in solutions having a pH above 6 may form a precipitate of vinblastine base. <sup>(1369)</sup>

*Freezing Solutions* — Vinblastine sulfate (Lilly) 20 mcg/mL in dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9% underwent no degradation after four weeks when frozen at -20

°C. [\(1195\)](#)

*Light Effects* — It is recommended that vinblastine sulfate, both in the dry state and in solution, be protected from light. [\(4\)](#)

The effects of light exposure on a 1.197-mg/mL vinblastine sulfate solution in sterile water for injection was studied. Samples at 25 °C were exposed to indirect incandescent (not fluorescent) light intermittently for 12 hours each day; another group was exposed to direct incandescent light intermittently for 12 hours daily with at least two additional hours of exposure to sunlight. A third group of samples at 30 °C were exposed to continuous direct incandescent light. Both groups of samples exposed directly to light showed substantial losses of vinblastine sulfate. Samples exposed to continuous direct light sustained a 10% loss in about one day and a 71% loss in 14 days. Samples intermittently exposed to direct light and sunlight sustained a 10% loss in eight days and a 23% loss in 15 days. However, samples exposed to intermittent indirect light showed no drug loss in 70 days. [\(1306\)](#)

Under 6% vinblastine loss occurred in 48 hours from a 3-mcg/mL solution in sodium chloride 0.9% contained as a static solution in polybutadiene tubing when exposed to normal mixed daylight and fluorescent light. It was concluded that photodegradation is not a problem with vinblastine sulfate. [\(1378\)](#)

*Syringes* — Vinblastine sulfate (David Bull Laboratories) 1 mg/mL in polypropylene syringes was stable for 31 days at 8 °C and for at least 23 days at 21 °C in the dark; little or no loss occurred. [\(1566\)](#)

Vinblastine sulfate (Lilly) 1 mg/mL in sodium chloride 0.9% was packaged in polypropylene syringes (Plastipak, Becton Dickinson) and stored at 25 °C protected from light. No vinblastine sulfate loss was found after storage for 30 days. [\(2155\)](#)

*Elastomeric Reservoir Pumps* — Vinblastine sulfate 0.2 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). Less than 1% binding was found after storage for two weeks at 35 °C with gentle agitation. [\(2014\)](#)

*Implantable Pumps* — Vinblastine sulfate (Lilly) 1 mg/mL in bacteriostatic sodium chloride 0.9% was evaluated for stability in an implantable pump (Infusaid model 400). In this in vitro assessment, a 24% vinblastine loss occurred in 24 hours at 37 °C with mild agitation. In 12 days, the loss totaled 48%. In comparison, control solutions in glass vials had no drug loss in 24 hours and a 20% loss in 12 days at 37 °C. The authors believed that this indicated an interaction of vinblastine with some component of the Infusaid model 400, rendering it unsuitable for administration with this infusion device. [\(767\)](#)

*Sorption* — The stability of vinblastine sulfate (Lilly) 3 mcg/mL in methacrylate butadiene styrene (Avon A2001 Sureset) and cellulose propionate (Avon A200 standard and A2000 Amberset) when exposed to normal mixed daylight and fluorescent light for up to 48 hours was evaluated. A maximum vinblastine loss of about 5% resulted in the Sureset, with as little as a 2.25% loss occurring with foil wrapping. However, significant losses occurred in both cellulose propionate burettes in 24 hours, and losses of 15 to 20% occurred in 48 hours. The vinblastine sulfate solution in the polybutadiene tubing of the Sureset showed no more than a 6% drug loss with or without light protection. However, in the PVC tubing of the standard or Amberset, losses were significant within four hours; at 48 hours, losses were 42 to 44%. [\(1378\)](#)

Vinblastine sulfate (Lilly) 10 mg/250 mL in dextrose 5% or sodium chloride 0.9%, in PVC bags at 22 °C with protection from light, was infused over two hours at 2.08 mL/min through PVC sets. No loss due to sorption was found. [\(1631\)](#)

Vinblastine sulfate (Lederle) 250 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption to PVC and polyethylene administration lines during simulated infusions at 0.875 mL/hr for 2.5

hours via a syringe pump. <sup>(1795)</sup>

*Filtration* — Vinblastine sulfate (Lilly) 10 mg/50 mL in dextrose 5% and sodium chloride 0.9%, filtered at a rate of about 3 mL/min through a 0.22-µm cellulose ester membrane filter (Ivex-2), showed no significant reduction due to binding to the filter. <sup>(533)</sup>

Vinblastine sulfate 10 to 300 mcg/mL exhibited no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters. <sup>(1415) (1416)</sup>

Vinblastine sulfate (Lederle) 250 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption to cellulose acetate (Minisart 45, Sartorius) and polysulfone (Acrodisc 45, Gelman) filters. However, a 10 to 20% loss due to sorption occurred during the first 30 to 60 minutes of infusion through nylon filters (Nylaflor, Gelman, and Utipore, Pall). About a 30% loss was found during the first hour using a positively-charged nylon filter (Posidyne ELD96, Pall). The delivered concentrations gradually returned to the full concentrations within 2 to 2.5 hours. <sup>(1795)</sup>

*Central Venous Catheter* — Vinblastine sulfate (Lilly) 0.12 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

### Compatibility Information

#### Solution Compatibility

##### Vinblastine sulfate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I
Dextrose 5%	TR <sup>a</sup>	LI	170 mg	Under 10% loss in 24 hr at room temperature	519	C

- Vinblastine Sulfate - AHFS 10:00

## Vincristine Sulfate - AHFS 10:00

**Products** — Vincristine sulfate is available as a preservative-free solution in a 1-mg/mL concentration with mannitol 100 mg/mL and sulfuric acid or sodium hydroxide to adjust pH during manufacturing. The ready-to-use solution is available in 1- and 2-mL single-dose vials. <sup>(1-8/06)</sup> (4)

*pH* — The official pH range is 3.5 to 5.5. <sup>(17)</sup> A narrower range of pH 4.0 to 5.0 has been cited by a manufacturer. <sup>(1-8/06)</sup>

**Administration** — Vincristine sulfate is administered intravenously only. It should not be given by any other route. A sticker is provided in the vincristine sulfate package that must be affixed directly to the container of the individual dose that states <sup>(1-8/06)</sup> :

***Fatal if given intrathecally. For intravenous use only.***

In addition, the container holding an individual dose must be enclosed in an overwrap which is labeled <sup>(1-8/06)</sup> :

***Do not remove covering until moment of injection.***

***Fatal if given intrathecally. For intravenous use only.***

The drug may be administered over one minute directly into a vein or into the tubing of a running infusion solution. <sup>(1-8/06)</sup> (4) It can also be diluted in dextrose 5% or sodium chloride 0.9% and given by intermittent or continuous intravenous infusion. <sup>(4)</sup> Extravasation should be avoided. <sup>(1-8/06)</sup> (4)

In the event of spills or leaks, sodium hypochlorite 5% (household bleach) has been used to inactivate vincristine sulfate. <sup>(1200)</sup>

**Stability** — The ready-to-use solution should be stored under refrigeration, kept upright, and protected from light. Unused drug solution should be discarded. <sup>(1-8/06)</sup> The pH range of maximum stability is 4 to 6. <sup>(1195)</sup> Precipitation may occur at alkaline pH values. <sup>(1369)</sup> Vincristine sulfate should not be added to solutions that would raise or lower the pH outside the 3.5 to 5.5 range. Only dextrose 5% and sodium chloride 0.9% are recommended. <sup>(1-8/06)</sup>

Admixtures containing doxorubicin hydrochloride, etoposide phosphate, and vincristine sulfate in a variety of concentration combinations in sodium chloride 0.9% were unable to pass the USP test for antimicrobial growth effectiveness. Mixtures of these drugs are not "self-preserving" and will permit microbial growth. <sup>(2343)</sup>

Immersion of a needle with an aluminum component in vincristine sulfate 1 mg/mL resulted in no visually apparent reaction after seven days at 24 °C. <sup>(988)</sup>

**Freezing Solutions** — Vincristine sulfate (Lilly) 20 mcg/mL in dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9% underwent no degradation after four weeks when frozen at -20 °C. <sup>(1195)</sup>

**Syringes** — Vincristine sulfate (Lilly) 0.5, 1, 2, and 3 mg diluted to 20 mL with sodium chloride 0.9% and packaged in 30-mL polypropylene syringes (Becton Dickinson) was stored for seven days at 4 °C followed by two days at 23 °C. All samples remained physically compatible with no increase in measured turbidity or particle content. No loss occurred after seven days at 4 °C and not more than 5% loss after two additional days at room temperature. <sup>(2350)</sup>

**Sorption** — Vincristine sulfate 2 mg/250 mL in dextrose 5% or sodium chloride 0.9%, in PVC bags at

22 °C with protection from light, was infused over two hours at 2.08 mL/min through PVC sets. No loss due to sorption was found.<sup>(1631)</sup>

Vincristine sulfate 25 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption to a polyethylene administration line (Vygon) during simulated infusions at 0.875 mL/hr for 2.5 hours via a syringe pump. However, about a 9% loss of delivered concentration due to sorption occurred during the first hour using a PVC administration line (Baxter). The delivered concentration returned to the full concentration within 1.5 hours.<sup>(1795)</sup>

**Filtration** — Vincristine sulfate (Lilly) 1 mg/50 mL in dextrose 5% and sodium chloride 0.9% was filtered at about 3 mL/min through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2). Losses of vincristine sulfate due to binding to the filters were noted in both solutions. In dextrose 5%, about 6.5% of the vincristine sulfate was bound; about 12% of the drug was lost from the sodium chloride 0.9% solution.<sup>(533)</sup>

In static equilibrium experiments, 100 mg of 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2) was soaked in 25 mL of vincristine sulfate (Lilly) 10 and 20 mcg/mL in both dextrose 5% and sodium chloride 0.9%. The higher concentration exhibited about 20 to 30% binding to the filter in 24 to 48 hours. The lower concentration had about 30 to 45% binding in the same period.<sup>(533)</sup>

A filter material specially treated with a proprietary agent was evaluated for a reduction in vincristine sulfate binding. Vincristine sulfate (Lilly) 1 mg/50 mL in dextrose 5% and sodium chloride 0.9% was run through an administration set with a treated 0.22- $\mu$ m cellulose ester inline filter at a rate of 3 mL/min. Cumulative vincristine sulfate losses of about 1% occurred from both solutions compared to the much higher losses previously reported for untreated cellulose ester filter material. Furthermore, equilibrium binding studies showed five- and sevenfold reductions in binding from dextrose 5% and sodium chloride 0.9%, respectively.<sup>(904)</sup> All Abbott Ivex integral filter and extension sets use this treated filter material.<sup>(1074)</sup>

Vincristine sulfate 1.5 mg/3 mL was injected through a 0.2- $\mu$ m nylon, air-eliminating, filter (Ultipor, Pall) to evaluate the effect of filtration on simulated intravenous push delivery. About 90% of the drug was delivered through the filter after flushing with 10 mL of sodium chloride 0.9%.<sup>(809)</sup>

Vincristine sulfate 10 to 200 mcg/mL exhibited a 10 to 15% loss due to sorption to both cellulose nitrate/cellulose acetate ester (Millex OR) and Teflon (Millex FG) filters.<sup>(1415) (1416)</sup>

Vincristine sulfate (David Bull Laboratories) 250 mcg/mL in sodium chloride 0.9% exhibited little loss due to sorption to cellulose acetate (Minisart 45, Sartorius) and polysulfone (Acrodisc 45, Gelman) filters. However, a 5 to 20% loss due to sorption occurred during the first 30 to 60 minutes of infusion through nylon filters (Nylaflo, Gelman, and Utipore, Pall). About a 20 to 25% loss was found during the first hour using a nylon filter (Posidyne ELD96, Pall). The delivered concentrations gradually returned to the full concentrations within 2 to 2.5 hours.<sup>(1795)</sup>

**Central Venous Catheter** — Vincristine sulfate (Lilly) 0.05 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>(2335)</sup>

## Compatibility Information

### Solution Compatibility

#### Vincristine sulfate

Solution	Mfr	Mfr	Conc/L	Remarks	Ref	C/I

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>d</sup>Lyophilized formulation tested.

<sup>e</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>f</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

Vincristine Sulfate - AHFS 10:00

## Vinorelbine Tartrate - AHFS 10:00

**Products** — Vinorelbine tartrate is available in a 10-mg/mL concentration in water for injection in 1- and 5-mL single-use vials. No preservatives or other additives are present. <sup>(1-7/05)</sup>

Vinorelbine tartrate should be diluted with a compatible diluent for administration. Because skin reactions may occur, gloves should be worn during preparation. <sup>(1-7/05)</sup>

*pH* — The injection has a pH of approximately 3.5. <sup>(1-7/05)</sup>

**Administration** — Vinorelbine tartrate is administered intravenously, after dilution, from a syringe (at a concentration of 1.5 to 3 mg/mL) or infusion solution minibag (at a concentration of 0.5 to 2 mg/mL) over six to 10 minutes into the side port of a free-flowing infusion solution closest to the infusion container. After administration, 75 to 125 mL of solution should be used as a flush. Extravasation should be avoided due to tissue irritation, necrosis, and thrombophlebitis. <sup>(1-7/05)</sup> A literature review for the period 1966 through 2004 did not find a statistically significant difference in the rate of venous irritation from one- to two-minute intravenous pushes and six- to 10-minute intravenous infusions. <sup>(2637)</sup>

Intrathecal injection of vinca alkaloids has resulted in death. When vinorelbine tartrate is dispensed in a syringe containing an individual dose, the syringe must be labeled with this statement <sup>(1-7/05)</sup> :

### **WARNING - FOR IV USE ONLY. FATAL if given intrathecally**

**Stability** — Vinorelbine tartrate injection is a colorless to pale yellow clear solution. Intact vials should be refrigerated at 2 to 8 °C and protected from light (by storage in the carton) and freezing. Intact vials are stable at room temperature (up to 25 °C) for 72 hours. <sup>(1-7/05)</sup>

When diluted to 1.5 to 3 mg/mL in polypropylene syringes or to 0.5 to 2 mg/mL in PVC infusion containers, vinorelbine tartrate is stable for 24 hours at 5 to 30 °C with exposure to normal room light. <sup>(1-7/05)</sup>

Vinorelbine tartrate 0.1 mg/mL diluted in sodium chloride 0.9% and stored at 22 °C did not exhibit an antimicrobial effect on the growth of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. The author recommended that diluted solutions of vinorelbine tartrate be stored under refrigeration whenever possible and that the potential for microbiological growth be considered when assigning expiration periods. <sup>(2160)</sup>

*Sorption* — Vinorelbine tartrate was shown not to exhibit sorption to PVC bags and tubing as well as polyethylene and glass containers. <sup>(1631) (2420) (2430)</sup>

### **Compatibility Information**

#### **Solution Compatibility**

##### **Vinorelbine tartrate**

Vinorelbine Tartrate - AHFS 10:00

## Vitamin A - AHFS 88:04

**Products** — Vitamin A 50,000 I.U./mL is available in 2-mL single-dose vials. Each milliliter also contains polysorbate 80, chlorobutanol, citric acid, and sodium hydroxide to adjust pH. <sup>(1-4/05)</sup>

*pH* — From 6.5 to 7.1. <sup>(4)</sup>

*Trade Name(s)* — Aquasol A Parenteral

**Administration** — Vitamin A is administered intramuscularly. <sup>(1-4/05)</sup> <sup>(4)</sup> Intravenous administration is not recommended. <sup>(1-4/05)</sup>

**Stability** — Vitamin A is a light yellow to amber or red oil. It is sensitive to, and should be protected from, light and air. <sup>(4)</sup> Intact vials should be stored under refrigeration and protected from light and freezing. <sup>(1-4/05)</sup> <sup>(4)</sup> Although refrigerated storage is required, the manufacturer has stated the drug may be stored at room temperature for 4 weeks. <sup>(2745)</sup>

The stability of retinol palmitate and tocopherols ( $\delta$ ,  $\gamma$ , and  $\alpha$ ) in 3-in-1 admixtures of amino acids 4%, dextrose 10%, fat emulsion 3% (Intralipid, Liposyn, and ClinOleic), various electrolytes, vitamins, and trace elements in ethylene vinyl acetate (EVA) bags over three days at 4, 25, and 37 °C was determined. Retinol palmitate was unstable at room temperature with 33 and 50% degradation at 24 and 72 hours after compounding, respectively. Refrigeration of the admixture reduced the degradation to 29% at 72 hours. <sup>(2460)</sup>

The degradation of vitamins A, B<sub>1</sub>, C, and E from Cernevit (Roche) multivitamins was evaluated in NuTRIflex Lipid Plus (B. Braun) admixtures prepared in ethylene vinyl acetate (EVA) bags and in multilayer bags. After storage for up to 72 hours at 4, 21, and 40 °C, greater vitamin losses occurred in the EVA bags. Vitamin A (retinyl palmitate) losses were 20%. In the multilayer bags (presumably a better barrier to oxygen transfer), vitamin A (retinyl palmitate) losses were 5%. <sup>(2618)</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the other vitamins, including vitamin A, retained their initial concentrations. <sup>(2796)</sup>

*Light Effects* — A parenteral nutrition solution in glass bottles exposed to sunlight was evaluated. Vitamin A decomposed rapidly, losing more than 50% in three hours. The decomposition could be slowed to approximately a 25% loss in three hours by covering the bottle with a light-resistant vinyl bag. <sup>(1040)</sup>

Vitamin A was rapidly and significantly decomposed when exposed to daylight. The extent and rate of loss were dependent on the degree of exposure to daylight which, in turn, depended on various factors such as the direction of the radiation, time of day, and climatic conditions. Delivery of less than 10% of the expected amount was reported. <sup>(1047)</sup> In controlled light experiments, the decomposition initially progressed exponentially. Subsequently, the rate of decomposition slowed. This result was attributed to a protective effect of the degradation products on the remaining vitamin A. The presence of amino acids provided greater protection. Compared to degradation rates in dextrose 5%, decomposition was reduced by up to 50% in some amino acid mixtures. <sup>(1048)</sup>

In a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, trace elements, and multivitamins in PVC bags stored at 4 and 25 °C, vitamin A rapidly deteriorated to 10% of the initial concentration in eight hours at 25 °C while exposed to light. The decomposition was slowed by light protection and refrigeration, with a loss of about 25% in four days. <sup>(1063)</sup>

Substantial loss of retinol all-*trans* palmitate was reported from both TPN and TNA admixtures due to

exposure to sunlight. In three hours' exposure to sunlight, essentially total loss of retinol had occurred. The presence or absence of lipids did not affect stability. The container material used to store the nutrition admixtures affected the concentration of the vitamins as well. Losses were greatest in PVC containers and were slightly better in EVA and glass containers. <sup>(2049)</sup>

The photodegradation of vitamin A in 2-in-1 (Synthamin 9, Glucose 20%) and 3-in-1 (Synthamin 9, Glucose 20%, Intralipid 20%, electrolytes, vitamins, trace elements) admixtures was reported after exposure to six hours of indirect daylight. The compounded admixtures were prepared in multilayer bags protected from light and stored at 5 °C for a minimum of five days. The same admixtures were prepared in EVA bags 24 hours prior to use with vitamins added prior to study. Vitamin A decreased to 60 to 80% of the initial concentrations in two to six hours. The type of bag had no influence on the photodegradation of vitamin A. Despite fat emulsion, no significant light protection was noted with the 3-in-1 admixture. The authors concluded that light protection can minimize vitamin A losses. <sup>(2459)</sup>

*Sorption* — Vitamin A (as the acetate) (Sigma) 7.5 mg/L displayed 66.7% sorption to a PVC plastic test strip in 24 hours. The presence of dextrose 5% and sodium chloride 0.9% increased the extent of sorption. <sup>(12)</sup>

Vitamin A acetate displayed 78% sorption to 200-mL PVC containers after 24 hours at 25 °C with gentle shaking. The initial concentration was 3 mg/L. The sorption was increased by approximately 10% in sodium chloride 0.9% and by 20% in dextrose 5%. <sup>(133)</sup>

However, vitamin A delivery is also reduced in glass intravenous containers. At a concentration of 10,000 units/L in glass and PVC plastic containers protected from light with aluminum foil, 77 and 71%, respectively, of the vitamin A were delivered in 10 hours. Without light protection, 61% was delivered from glass and 49% from PVC plastic containers over a 10-hour period. <sup>(290)</sup>

In another test using multivitamin infusion (USV), one ampul/L of sodium chloride 0.9% in glass and PVC containers not protected from light, 69.4 and 67.9% of the vitamin A were delivered from the glass and PVC containers, respectively, in 10 hours. The amount of vitamin A was constant over this test period, not decreasing with time. <sup>(282)</sup>

The delivery of vitamins A, D, and E from a parenteral nutrition solution composed of 3% amino acid solution (Pharmacia) in dextrose 10% with electrolytes, trace elements, vitamin K, folate, and vitamin B<sub>12</sub> was evaluated. To this solution was added 6 mL of multivitamin infusion (USV). The solution was prepared in PVC bags (Travenol), and administration was simulated through a fluid chamber (Buretrol) and infusion tubing with a 0.5- $\mu$ m filter at 10 mL/hr. During the first 60 to 90 minutes, minimal delivery of the vitamins occurred. Then a rise and a plateau in the delivered vitamins followed and were attributed to an increasing saturation of adsorptive binding sites in the tubing. Total amounts delivered over 24 hours were: vitamin A, 31%; vitamin D, 68%; and vitamin E, 64%. Sorption of the vitamins was found in the PVC bag, fluid chamber, and tubing. Decomposition was not a factor. <sup>(836)</sup>

A patient receiving 3000 I.U. of retinol daily in a parenteral nutrition solution nevertheless experienced two episodes of night blindness. The pharmacy prepared the parenteral nutrition solution in 1-L PVC bags in weekly batches and stored them at 4 °C in the dark until use. A subsequent *in vitro* study showed losses of vitamin A of 23 and 77% in three- and 14-day periods, respectively, under these conditions. About 30% of the lost vitamin A could be extracted from the PVC bag. <sup>(1038)</sup>

Losses of vitamin A from neonatal parenteral nutrition solutions containing multivitamins (USV) was reported. The solution was prepared in colorless glass bottles and run through an administration set with a burette (Travenol). The total loss of vitamin A was 75% in 24 hours, with about 16% as decomposition in the glass bottle. The decomposition was not noticeable during the first 12 hours, but then vitamin A levels fell rather precipitously to about one-third of the initial amount. The balance of the loss, averaging about 59%, occurred during transit through the administration set.

Removal of the inline filter and treatment of the set with albumin had no effect on vitamin A delivery. The authors recommended a three- to fourfold increase in the amount of vitamin A to compensate for the losses. <sup>(1039)</sup>

A 50% loss of vitamin A was noted from a bottle of parenteral nutrition solution prepared with multivitamin infusion (USV) after 5.5 hours of infusion. The amount delivered through an Ivex-2 filter set was only 6.3% of the added amount. Similar quantities were found after 20 hours of infusion. A reduced light exposure and use of <sup>3</sup>H-labeled vitamin A confirmed binding to the infusion bottles and tubing. <sup>(704)</sup>

Solutions containing multivitamins (USV) spiked with <sup>3</sup>H-labeled retinol in intravenous tubing protected from light and agitated to simulate flow for five hours were evaluated. About half of the vitamin A was lost in 30 minutes, and 88 to 96% was lost in five hours. Hexane rinses and radioactivity determinations on the tubing accounted for the decrease in radioactivity. <sup>(1049)</sup>

Neonatal parenteral nutrition solutions containing multivitamins prepared in bags were delivered at 10 mL/hr through Buretrol sets (Travenol). The bags and sets were protected from light. About 26% of the vitamin A was lost before the flow was started. At 10 mL/hr, about 67% was lost from the effluent. More rapid flow reduced the extent of loss. Analysis of clinical samples of parenteral nutrition solutions showed losses of 21 to 57% after 20 hours. Because losses after five hours were of the same magnitude, the authors concluded that the loss occurs rapidly and is not due to gradual decomposition. <sup>(1049)</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8 °C for 96 hours with no significant loss of retinyl palmitate. <sup>(1225)</sup>

When the admixture was subjected to simulated infusion over 24 hours at 20 °C, either exposed to room light or light protected, or stored for six days in the dark under refrigeration and then subjected to the same simulated infusion, once again the retinyl palmitate did not undergo significant loss. <sup>(1225)</sup>

Retinol losses of 40% occurred in two hours and 60% in five hours from parenteral nutrition solutions pumped at 10 mL/hr through standard infusion sets at room temperature. The retinol concentration in the bottle remained constant while the retinol in the effluent decreased. Antioxidants had no effect. Much of the vitamin A was recoverable from hexane washings of the tubing. <sup>(1050)</sup>

The stability of several vitamins from M.V.I.-12 (Armour) admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, when stored in glass bottles and PVC bags at 25 and 5 °C for 48 hours was reported. No vitamin A was lost from any formula in glass bottles, but samples in PVC containers lost as much as 35 and 60% at 5 and 25 °C, respectively, in 48 hours. <sup>(1431)</sup>

The stability of vitamin A was studied in two parenteral nutrition solutions. In TPN #172 (see Appendix I), a 10% loss of vitamin A palmitate occurred in about 20 days in PVC bags while no loss occurred in Buretrol chambers in 21 days at 30 °C with exposure to normal ward light. In TPN #173 (see Appendix I), a 10% loss of vitamin A palmitate occurred in about 12 days in both glass and PVC containers at 2 to 8 °C with protection from light. <sup>(1606)</sup>

The effects of the fat emulsion concentration on vitamin A stability in several parenteral nutrition solutions were evaluated. Vitamin A palmitate was not absorbed into PVC containers from Intralipid 10%. Among TPN solutions with lower Intralipid contents, no correlation existed between the fat emulsion content and the extent of vitamin A loss during refrigerated storage. The fat emulsion content afforded vitamin A some protection from decomposition due to light exposure at 30 °C. <sup>(1607)</sup>

The quantity of retinol delivered from an M.V.I.-containing 2-in-1 parenteral nutrition solution and when M.V.I. was added to Intralipid 10% was evaluated during simulated administration through a PVC administration set. The parenteral nutrition solution was composed of amino acids 2.8%, dextrose 10%, and standard electrolytes; M.V.I. was added to yield a nominal retinol concentration of 455 mcg/150 mL. Retinol losses were about 80% of the admixed amount after being delivered through the PVC set. When M.V.I. was added to Intralipid 10% in a retinol concentration of 455 mcg/20 mL, retinol losses were reduced to about 10% of the admixed amount. The fat emulsion provided retinol protection from sorption to the PVC administration set.<sup>(2027)</sup>

Substantially higher amounts of retinol were found to be delivered using polyolefin administration set tubing than with PVC tubing during simulated neonatal intensive care administration. Retinol was added to a 2-in-1 parenteral nutrition solution (TPN #206) in concentrations of 25 and 50 I.U./mL and run at 4 and 10 mL/hr through three meter lengths of polyolefin (MiniMed) and PVC (Baxter) intravenous extension set tubing protected from light and passed through a 37 °C water bath. Delivered quantities of retinol varied from 19 to 74% through the PVC tubing and 47 to 87% through the polyolefin tubing. The loss of retinol to the PVC tubing appeared to be saturable. Even so, the use of polyolefin tubing increases the amount of retinol delivered during simulated neonatal administration.<sup>(2028)</sup>

To minimize the importance of sorption, use vitamin A palmitate, which does not sorb as extensively to PVC<sup>(1033)</sup> <sup>(1606)</sup> <sup>(2026)</sup>, instead of the acetate. However, this change does not alter the problem of degradation from exposure to light. Alternatively, an excess of vitamin A could be used.<sup>(1033)</sup>

*Plasticizer Leaching* — Vitamin A leached significant amounts of diethylhexyl phthalate (DEHP) plasticizer from PVC bags and administration set tubing.<sup>(1621)</sup>

## Voriconazole - AHFS 8:14.08

**Products** — Voriconazole is available as a lyophilized powder in single-use vials containing 200 mg with 3.2 g of sulfobutyl ether  $\beta$ -cyclodextrin sodium and bearing a vacuum. Reconstitute with 19 mL of sterile water for injection and shake well to yield 20 mL of a voriconazole 10-mg/mL solution. Do not use the vial if a vacuum does not draw in the diluent for reconstitution. [\(1-5/08\)](#)

The reconstituted solution is a concentrate that must be diluted in a compatible solution to a concentration of 0.5 to 5 mg/mL before intravenous administration. The manufacturer recommends removing a volume equivalent to the volume of drug before addition to the bag. [\(1-5/08\)](#)

*Trade Name(s)* — Vfend

**Administration** — Voriconazole is administered by intravenous infusion in a compatible infusion solution at a concentration between 0.5 and 5 mg/mL over one to two hours at a maximum rate of 3 mg/kg/hr. [\(1-5/08\)](#)

**Stability** — Intact vials should be stored at controlled room temperature. Voriconazole reconstituted as directed is chemically and physically stable for 24 hours under refrigeration. However, because no antimicrobial preservative is present, the manufacturer recommends use immediately after reconstitution. Voriconazole is intended for single use, and any remaining drug should be discarded. [\(1-5/08\)](#)

## Warfarin Sodium - AHFS 20:12.04.08

**Products** — Warfarin sodium is available as a lyophilized powder in vials containing a total of 5.4 mg of drug. When reconstituted with 2.7 mL of sterile water for injection, each milliliter of solution contains warfarin sodium 2 mg with sodium phosphate salts, sodium chloride, mannitol, and sodium hydroxide to adjust pH. The maximum amount of withdrawable solution is about 2.5 mL. <sup>(1-1/09)</sup>

*pH* — From 8.1 to 8.3. <sup>(1-1/09)</sup>

*Trade Name(s)* — Coumadin

**Administration** — Warfarin sodium is administered by slow intravenous injection over one to two minutes into a peripheral vein. It should not be given intramuscularly. <sup>(1-1/09)</sup>

**Stability** — Intact vials should be stored at controlled room temperature and protected from exposure to light. After reconstitution, warfarin sodium is physically and chemically stable for only four hours at room temperature. The reconstituted solution should not be refrigerated. If either particulates or discoloration is noted, the drug should be discarded. Unused solution also should be discarded. <sup>(1-1/09)</sup>

*pH Effects* — A precipitate may form in solution due to formation of the poorly soluble enol form of warfarin at pH values below 8. At pH 8 or higher, clear stable solutions result because the warfarin is in the soluble enolate form. <sup>(964)</sup>

*Sorption* — Warfarin sodium (Abbott) 25 mg/L displayed 11.7% sorption to a PVC plastic test strip in 24 hours. The presence of dextrose 5% increased the extent of the sorption. <sup>(12)</sup>

Warfarin sodium 22 mg/L in sodium chloride 0.9% (Travenol) in PVC bags exhibited approximately a 15% loss in one week at room temperature (15 to 20 °C) due to sorption. However, when the solution was buffered from its initial pH of 6.7 to 7.4, no significant loss of drug due to sorption was observed over the one-week study period. <sup>(536)</sup>

In another study, warfarin sodium 22 mg/L in sodium chloride 0.9% did not exhibit any loss due to sorption during a seven-hour simulated infusion through an infusion set (Travenol) consisting of a cellulose propionate burette chamber and 170 cm of PVC tubing. <sup>(606)</sup>

The drug was also tested as a simulated infusion over at least one hour by a syringe pump system. A glass syringe on a syringe pump was fitted with 20 cm of polyethylene tubing or 50 cm of Silastic tubing. No loss of drug due to sorption was observed with either tubing. <sup>(606)</sup>

In addition, a 25-mL aliquot of warfarin sodium 22 mg/L in sodium chloride 0.9% was stored in all-plastic syringes composed of polypropylene barrels and polyethylene plungers for 24 hours at room temperature in the dark. No loss due to sorption occurred. <sup>(606)</sup>

The sorption of warfarin sodium 20 mg/L in sodium chloride 0.9% was evaluated in 100-mL PVC infusion bags (Travenol). After eight hours at 20 to 24 °C, 29% of the warfarin was lost. Adjusting the pH of the solution to 2 or 4 increased the sorption in eight hours to 49% because of the increased amount of un-ionized warfarin present in the solution at these low pH values. The un-ionized form is most favorably sorbed by the plastic. The concentration of warfarin sodium in solution also affects the pH and, thereby, the extent of sorption. Table 1 shows that as the warfarin sodium concentration is reduced, small changes in the pH of the solution occur. Even these small pH changes result in a greatly increased extent of sorption at equilibrium (about 100 hours of exposure). <sup>(770)</sup>

### **Table 1. Extent of Equilibrium Sorption of Warfarin Sodium in Sodium Chloride 0.9% in**

**PVC Bags**<sup>770</sup>

<b>Initial</b>		
<b>Concentration</b>	<b>Extent of Sorption</b>	
<b>(mg/mL)</b>	<b>pH</b>	<b>(%)</b>
1.31	6.95	4
0.433	6.55	6
0.190	6.27	18
0.093	6.04	24
0.048	5.90	30
0.024	5.78	45
0.009	5.65	66

Warfarin sodium showed a negligible (less than 3%) loss if the aqueous solutions at pH 2 to 7 were stored in polypropylene infusion bags.<sup>(770)</sup>

## Ziconotide Acetate - AHFS 28:08.92

**Products** — Ziconotide acetate is available as a 100-mcg/mL solution in 1-, 2-, and 5-mL single-use vials and as a 25-mcg/mL solution in 20-mL single-use vials. The formulation also contains l-methionine and sodium chloride excipients. [\(1-2/08\)](#)

*pH* — From 4 to 5. [\(1-2/08\)](#)

*Trade Name(s)* — Prialt

**Administration** — Ziconotide acetate is administered intrathecally either undiluted or diluted in preservative-free sodium chloride 0.9% using a programmable implanted variable-rate microinfusion device or an external microinfusion device and catheter. The drug is intended for use only with the following infusion devices: Medtronic Synchromed EL, SynchroMed II Infusion System, and the CADD-Micro ambulatory infusion pump. [\(1-2/08\)](#)

When using the Medtronic Synchromed pumps, only the undiluted 25-mcg/mL concentration should be used for the initial priming of a new pump. Three 2-mL rinses of the new pump should be performed using the 25-mcg/mL concentration. After performing the initial rinses of a new pump, only the 25-mcg/mL concentration should be used for the first fill. [\(1-2/08\)](#)

It should be refilled within 14 days because of initial loss of drug due to sorption to titanium internal surfaces and residual spaces in the pump. These losses do not persist after the initial use. [\(1-2/08\)](#)

Subsequently, the pumps may be filled with undiluted ziconotide acetate at least every 84 days or every 40 days if the drug is diluted using a Medtronic refill kit to assist in maintaining asepsis. The pumps should be emptied of any remaining solution prior to refilling. [\(1-2/08\)](#)

When using the CADD-Micro ambulatory infusion pump, the pump should be initially filled with ziconotide acetate 5 mcg/mL diluted in preservative-free sodium chloride 0.9%. The pump manufacturer's instructions for pump filling and refilling of the pump reservoir should be followed. [\(1-2/08\)](#)

**Stability** — Intact vials of ziconotide acetate should be stored under refrigeration and protected from light and freezing. Ziconotide acetate diluted in preservative-free sodium chloride 0.9% is stable for 24 hours under refrigeration. [\(1-2/08\)](#)

*Implantable Pumps* — Clonidine hydrochloride and morphine sulfate powders were dissolved in ziconotide acetate (Elan) injection to yield concentrations of 2 and 35 mg/mL and 25 mcg/mL, respectively. Stored at 37 °C, 11% ziconotide loss in 7 days, 4% clonidine loss in 20 days, and no morphine loss in 28 days occurred. [\(2752\)](#)

Ziconotide Acetate - AHFS 28:08.92

## Zidovudine - AHFS 8:18.08.20

**Products** — Zidovudine is available in 20-mL single-use vials. Each milliliter of solution contains zidovudine 10 mg in water for injection. Hydrochloric acid and/or sodium hydroxide may be present to adjust the pH. <sup>(1-10/06)</sup>

*pH* — Approximately 5.5. <sup>(1-10/06)</sup>

*Trade Name(s)* — Retrovir

**Administration** — Zidovudine must be diluted in dextrose 5% to a concentration no greater than 4 mg/mL prior to administration. The drug is administered by intravenous infusion at a constant rate over one hour. <sup>(1-10/06)</sup> <sup>(4)</sup> Zidovudine has also been administered by continuous intravenous infusion. <sup>(4)</sup> Intramuscular injection, intravenous bolus, and rapid intravenous infusion should be avoided. <sup>(1-10/06)</sup> <sup>(4)</sup>

**Stability** — Intact vials of zidovudine should be stored at 15 to 25 °C and protected from light. <sup>(1-10/06)</sup>

*Central Venous Catheter* — Zidovudine (Glaxo Wellcome) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter. <sup>(2335)</sup>

<sup>a</sup>Tested in dextrose 5%.

<sup>b</sup>Tested in sodium chloride 0.9%.

<sup>c</sup>Sodium bicarbonate 2.5 mEq added to adjust pH.

<sup>d</sup>Tested in sterile water for injection.

<sup>e</sup>Lyophilized formulation tested.

<sup>f</sup>Refer to Appendix I for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>g</sup>Test performed using the formulation WITHOUT edetate disodium.

<sup>h</sup>Piperacillin sodium component. Piperacillin sodium in an 8:1 fixed-ratio concentration with tazobactam sodium.

<sup>i</sup>Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

## Appendix I: Parenteral Nutrition Formulas

The following tables summarize the composition of the total parenteral nutrition mixtures that are referenced throughout the *Handbook on Injectable Drugs*. Each unique formula that has been tested for stability and/or compatibility characteristics, alone or in combination with other drugs, is described and assigned a code number. These code numbers are used in the drug monographs to denote the TNA (3-in-1) or TPN (2-in-1) formulation being discussed (i.e., TPN #183, TPN #184, etc.). The TNA and TPN formulations are described as completely as possible from the original published sources.

The consolidation of the formulations into a single appendix is designed to avoid unnecessary repetition and to facilitate comparisons among different mixtures.

Component	Mfr	Concentration per Liter			
		#21	#22	#23	#24
Amino acids	MG	200 mL			
Amino acids 8.5% with electrolytes	TR		500 mL	500 mL	500 mL
