	<p>SIMON</p> <p>The following is a sample file showing how the script looks originally. There are two columns, the right column containing what is said or done, and the left column containing the times at which these actions are supposed to take place. The timecodes synchronise with the first word of the line they are on. A timecode is also added as soon as possible at the start of every minute.</p>
00:25:03	<p>PETER</p> <p>The main issue has been preserving line spaces when attempting to adjust all timecodes by a certain offset.</p>
	<p>SIMON</p> <p>This has been a particular issue because Word seems to import only one timecode per cell when exporting from Excel, though there may be many when timecodes per cell, as you can see. Also, the spacing is not preserved, and each timecode is dropped to the bottom of the cell, and does not correspond to the relevant speech or event.</p>
