Solution To Fix Webroot Error Message:

1. Webroot Error(UPW003): Your reset password request cannot be processed

1. This error means that your account is not created or not confirmed.

2. It also means that the email address which you are using is incorrect and you should use another email address to create your account.
3. In case, if you have not made the account then you can create an online management account.
4. Here, you should also create a Password and Personal Security Code.
5. And most importantly, if you already have the account but you have not confirmed it then you should first confirm it.

2. Webroot Error(URFL103): Unable to register the keycode

1. This means that the keycode which you are entering for creating new account, but the keycode has already been registered.
2. You should login to your account management website instead of creating account.
3. May be you have used another email address for creating an account and you should try other email addresses which you have used.
4. There are chances that the email address is correct but the password is wrong. So in this case, you should reset the password.

3. Webroot Error(WB102): Registration cannot be completed:

1. In this case, you should complete the registration for your online management account.
2. And after this, you should send the message to your Webroot support team as they will help you to fixing the error.

4. Webroot Error(UCR2): Invalid Security Code Credentials

1. For this, you should re-enter your security code. The security code is basically a code which you use to create your account. It is not similar to your keycode. Security code is consist of 6 letters or numbers and different from your password and also from your security question.
2. It is requested that you must remember the code which you had created.
3. Always remember that the credentials are case sensitive. If you remember your credentials, then you should click on the link which is there in your email to complete setting up your account.
4. But in case, you do not remember your security code then you should reset your login credentials.

5. Webroot Error(UPA004): Your reset password request cannot be processed because details do not match

1. This error occurs when the answer to the security questions is entered incorrectly.
 2. You must remember that the secret question is personal information which you have entered during account creation for security. See: webroot.com/safe
3. As the answer to the secret question is case sensitive, so you should try different capitalization if you receive this error.

6. Webroot Error URFL044 Webroot Error Message: This keycode cannot be registered

1. In case, you receive this error during account creation, this means an account has already been created.
2. In this case, instead of trying to create an account, you should try to log in. If you are not sure about the login credentials then you can reset the password.
3. If you are not able to log in, or if your email address is not recognized, then you should contact to the [Webroot Support team](#).

These are all the errors which you face while installation. For more details about Webroot, just go to the site via webroot.com/safe.
