

All of the known Universe has been discovered. Only 3 intelligent and sentient species have been discovered. Humans no explanation required. The Lardo a reptilian race that has left there war like ways a long time ago. The Shen a peaceful race who has excepted the other races in the name of peace. With every corner and planet in the Universe looked at and studied only a few questions remains. What makes an intelligent being? Should the ability to converse be the standard? Or should beings like the Dolphin on the Human home world be considered? Why do some beings develop intelligence and some don't? What kind of experiments could be run to answer these questions? Each race has picked there most intelligent representative on the Council space base to answer this question. You've been picked as the human representative.

(Rather than get an ongoing story and that's fine if we can get it going. I want each person's ideals I know someone is going to say we still haven't found intelligent life ha ha. And that is an argument. I think the best science fiction gets you to think about the universe and our place in it. It expands your consciousness and your ideals of what's possible. 2001 A Space Odyssey, Arrival, Star Trek when it's good. Hope to get some responses. Thanks for reading have a nice day.)
