

# How do washing machines clean clothes?

In the first time, people notice what you are wearing. It doesn't mean the style of your clothes or how it fit with your body! But the thing is how clean and new or dirty and worn those clothes are. Actually, our clothes are important to us and we spend lots of energy to keep them clean and also gorgeous.

There are many ways to keep our clothes clean. The most used option is wet cleaning. That means cleaning water with water and some type of soap. On the other hand, dry cleaning uses various chemical or ultrasonic devices. They loose and remove dirt and stains. In this option no water is needed. Dry cleaning is not possible in home and one needs to go to professional dry cleaner's shops. In contrast, wet cleaning is possible in home. Washing machine itself has made a radical change in wet cleaning.

It has stopped you or your family going in laundry in a regular routine time.

When the washing machine was invented in the early 19th century, it was mainly a hand cranked device. It used to use water, soap to remove dirt from clothes and linen. Modern washing machine works in the same pattern. Here in modern time every washing machine is motor powered and there is also built in spin cycle. Almost all the washing machine are automated. They removes dirt from clothes using water/hot water and soap or detergent.

So, what washing machine actually do to clean to clothes? This article answers your question with basic discussion.
