

Beautify Your Eyes Permanently with the Eye Color You Want

It is said that the beauty of the face lies in the eyes. Surely, eyes play a very important role in defining your personality. Adding to all those extra adjectives, eye color is one of the most important traits that reveal what you are. But many of us are not happy with our natural eye color. We always strive to get our desired eye color by wearing lenses or something equivalent to that. But the question is, can eye color be changed permanently? Like you, many of the people are finding an answer to this question. And the answer is, yes, your eye color can be changed permanently.

Along with the rapid growth of the medical industry, we have come across a lot of improvements in the field of cosmetic surgeries that can beautify you in the way you want. But changing your eye color permanently has always been a myth. People used to cover up this trait using lenses. But now there is a new technology that lets you change your eye color permanently. Let us know more about it-

The color of our eye is determined by the iris. It is the pigmented part of the eye that is colored according to heredity. The two types of pigments called melanin and lipofuscin determine the eye color, whether it is brown, gray, blue, black or green. The bright Ocular is a procedure that lets you change your eye color through artificial iris implant. An artificial iris is a thin, non-toxic, flexible prosthesis that can be compared with any body tissue. The artificial iris is made of the materials those are used to produce intraocular lenses. The bright Ocular artificial iris implant procedure is safe, painless and time-saving. The basic procedure is to fold the artificial iris and insert it into the eye.

This artificial iris implant technology was first invented for medical purposes. The following problems would also be solved by this procedure:

- People with two different eye color
- Albinism
- People with no iris
- Severe iris atrophy
- Coloboma
- Cystic and multilayer iris

Now the surgery is also being used for beautification in the simplest possible way. Patients can also work after the surgery. Refractive errors or similar problems can't be corrected by this surgery.

Another way of changing your eye color is laser eye color change surgery. The process treats each eye separately. The patients are asked to keep their head fixed and the laser treats the eyes. This technique is performed to turn brown eyes into blue. The laser technology is very simple, is performed in no time and requires less hassle. Patients can get back to their normal working life immediately.

The change of eye color is performed simply for beautification. It is the simplest possible way to give your eyes the color you always wanted, permanently. But you can get back your original color whenever you want.
