

What Do Termites Look Like?

Termites are unmissable when they take up residence in your home. These tiny insects appear as mounds of soil and wood pulp if they have excavated the foundation. However, their presence is often detected by a strong musty odor, or small piles of excrement known as “frass” that they leave behind regularly. CAS stands for chemical attack strategy. It’s a pest control method used to eradicate termites and other pests that infest homes or buildings. There are also other things you can do to keep these insects from taking over your house. Let’s find out more about [what do worker termites](#) look like and how you can tackle an infestation at home before it gets worse.

What Do Termites Look Like?

When they are not eating your home, termites are brown insects that are roughly the size of a pinhead. While they are small, they are also hard to spot. The best way to check for infestation is to look for the signs that termites leave behind. If you see soil, wood chips, or small piles of sawdust, you might have an infestation. These signs can be anywhere in your home, and that means you have to inspect thoroughly. The best time to check for termites is in the early spring. Termites live in colonies, and the queen is responsible for laying eggs. The eggs hatch in the spring, and the larvae feed on the queen’s droppings. They grow into adult termites, which then feed on wood and build mounds.

How to Identify a Termite Infestation

Termites attack homes year-round, so there’s no off-season when you can forget about them. The first sign of an infestation is a mound of soil, wood shavings, and droppings on or near your home. [What do termites look like to human eye?](#) You can also check for termites in your home’s wood furniture, walls, and floors. These insects are notorious for eating furniture. If you see small holes in your wooden furniture, it could be an indication that termites are eating it from the inside. You can also check for termites by placing a small piece of cardboard on the floor. If you see termites on the cardboard, the infestation is in your home. If you spot any of these signs, you have a termite problem. The process of eliminating the infestation is lengthy, so you have to start treatment as soon as possible.

5 Ways to Repel Termite Mounds

Termites are attracted to wood and damp soil. If you can keep these two things away from your home, you can prevent termites from building mounds on or near your house. Here are a few ways to protect your home from termites:

- Clean gutters and drain spouts. Termites prefer wood that's covered in moss or built up with dirt. If you keep the areas around your house clear of debris and build-up, you can prevent termite mounds.
- Don't store wood in your backyard. Termites love to eat wood, so they'll happily do so if you leave it lying around. Instead, keep wood piles in a shed or garage.
- Build a brick wall around your home. Termite mounds are soft, and brick is hard. If you have a brick wall around your house, the termites won't be able to build mounds against it.
- Remove any rotting wood from the inside of your home. Termites are attracted to rotting wood, so you have to protect the inside of your home.

3 Ways To Protect Your Home From Termite Damage

Here are a few ways to protect your home from termite damage:

- Seal cracks and crevices. Termites can squeeze their way through tiny crevices, so you have to seal the areas where they might enter your home. Check for loose boards and seal siding, windows, and doors.
- Install termite shields. If you have a wooden foundation, you can protect it from termites with a steel shield. This device also protects PVC piping as well as telephone wires.
- Install a termite detector. You can use a termite detector to alert you when a termite has entered your home. These devices are inexpensive and easy to use. A detector can help you to catch an infestation early, so you can take steps to eradicate it. These devices are small boxes that have a small viewing window. They detect vibrations and alert you when a termite enters the box.

Conclusion

Termites are tiny insects that can quickly cause a huge amount of damage to your home and property. These pests are particularly destructive in the spring and early summer, when they build large mounds of soil and wood shavings and feed on the wood that supports your home. The best way to protect yourself against termites is to prevent an infestation in the first place. You can do this by keeping wood out of areas where it might attract termites, keeping your home well-sealed, and installing a termite detector to alert you when pests have entered your home.
