Question No. 1

An administrator wants to use an existing Aruba gateway's firewall policies to filter both wireless and wired traffic. Which AOS-CX switch feature should a customer implement to ensure the gateway applies the same or similar firewall policies to users' wired and wireless traffic?

- A. GRE tunneling
- B. User-based tunneling
- C. Port-based tunneling
- D. IPSec tunneling

Answer: A

Question No. 2

The company has just upgraded their access layer switches with AOS-CX switches and implemented an AAA solution with ClearPass. The company has become concerned about what actually connects to the user ports on the access layer switch. Therefore, the company is implementing 802.1X authentication on the AOS-CX switches. An administrator has globally enabled 802.1X, and has enabled it on all the access ports connected to user devices, including VoIP phones, security cameras, and wireless Aruba IAPs. Wireless users are complaining that they successfully authenticate to the IAPs; however, they do not have access to network resources. Previously, this worked before 802.1X was implemented on the AOS-CX switches.

What should the company do to solve this problem?

- A. Implement device-based mode on the IAP-connected AOS-CX switch ports.
- B. Implement local user roles and local forwarding on the AOS-CX switches.
- C. Implement downloadable user roles and user-based tunneling (UBT) on the AOS-CX switches.
- D. Implement AAA RADIUS change of authorization on the AOS-CX switches.

Answer: C

Question No. 3

An administrator wants to implement a virtual switching technology that implements a single control-plane solution. Which S-CX switches would meet these criteria?

- A. All AOS-CX switching platforms
- B. AOS-CX 6300 and 6400 switches
- C. AOS-CX 6300, 6400, and 83xx switches
- D. AOS-CX 6300 switches

Answer: C

Question No. 4

An administrator is implementing a multi-area OSPF network. The network contains a backbone (area 0) and two other areas (1 and 2) connected to ABRs in the backbone. The network has one routing switch connected to a service provider located in area 2. Which network design would minimize the number of routes in the routing switches' link state databases (LSDBs) while still allowing full connectivity?

- **A.** Area 0: Normal Area 1: Totally stubby Area 2: Totally stubby
- **B.** Area 0: Normal Area 1: Totally not-so-stubby Area 2: Totally stubby
- **C.** Area 0: Normal Area 1: Totally stubby Area 2: Totally not-so-stubby
- **D.** Area 0: Not-so-stubby Area 1: Totally not-so-stubby Area 2: Totally not-so-stubby

Answer: D

Question No. 5

When cutting and pasting configurations into NetEdit, which character is used to enter commands within the context of the previous command?

- **A.**
- **B.** ">"
- **C.** Space
- **D.** Tab

Answer: D
