Kits for apoptosis and intracellular protease study

Kits Immunochemistry Caspases detection

Non-cytotoxic fluorescent probes that fix themselves in a covalent way to the active caspases.

The FLICA (Fluorescent Labeled Inhibitor of Caspases) are probes made with an inhibitory peptide sequence (fragment fluoromethyl ketone FMK) which facilitate the irreversible liaison between active caspase and fluorochrome.

Cellular membrane is permeable to the FLICA probe that enables to quantify the apoptosis on cells and tissues in culture.

Kits Immunochemistry for detection of mitochondrial potential

The changment of mitochondrial potential can lead to the initiation of apoptose or be involved in the study of cellular metabolism.

Thanks to the use of fluorescents potentiometric probes (JC-1, TMRE ou TMRM, MitoPT®), it is possible to detect the changment of mitochondrial potential in apoptose an changment of mitochondrial potential and to assess the depolarization of mitochondrial membranes.

Results can be analysed by fluorescence microscopy, fluorescence plate lector or flows cytometry.
