Gastric Balloon For Weight Loss in Dubai

Are you struggling to lose weight and looking for a non-surgical solution? Consider the gastric balloon procedure—a safe and effective option for [Weight Loss in Dubai](#). In this article, we will explore the benefits, procedure, and other essential details regarding gastric balloons in Dubai.

Introduction

Weight loss can be a challenging journey for many individuals. While diet and exercise are the foundation of a healthy lifestyle, some people may require additional support to achieve their weight loss goals. This is where the [Gastric Balloon in Dubai](#) comes into play, providing an alternative for those who want to avoid invasive surgical procedures.

What is a Gastric Balloon?

A gastric balloon is a non-surgical medical device designed to aid weight loss. It is a temporary implant that is inserted into the stomach to reduce its capacity, promoting a feeling of fullness and thereby limiting food intake. The balloon is typically made of silicone and is filled with saline solution or air.

Gastric Balloon For Weight Loss in Dubai

How Does Gastric Balloon Work?

The gastric balloon works by occupying space in the stomach, creating a feeling of satiety. Once inserted, it reduces the available space for food, making the person feel fuller quicker and consume smaller portions. This encourages portion control and helps individuals adhere to a lower-calorie diet.

Types of Gastric Balloons

There are different types of gastric balloons available, including:

Single Intra-gastric Balloon: This is a single balloon placed in the stomach.

Dual Intra-gastric Balloon: It consists of two balloons connected by a tube, providing additional stability and reducing the risk of migration.

Integrated Intra-gastric Balloon: This type incorporates a balloon with an integrated monitoring system to track the patient's progress.

The Gastric Balloon Procedure in Dubai

The [Gastric Balloon Placement in Dubai](#) follows a simple and minimally invasive approach. The patient is typically placed under sedation or general anesthesia. A deflated gastric balloon is inserted through the mouth and esophagus into the stomach using an endoscope. Once positioned correctly, the balloon is filled with a sterile solution or air, expanding its size.
